All kinds of new things are cookin' for you at Gateway 2000.

We have a brand-new application software buffet. When you buy a Gateway 2000 system, you get to choose one free software package from a smorgasbord of offerings.

There's a new fax/modem card on the menu, too. It's the Gateway TelePath – a 14,400 bps modem with 9,600 bps fax capability. The card comes with WinFax Pro™ and Crosstalk for Windows, plus a free CompuServe Basic Services trial membership, all for \$195.

If you're hungry for an ultra high-performance system at a great price, take a look at our new 50MHz 486DX2

computers. Both ISA and EISA models are based on the Intel486™ DX2 dual speed processor. With a system clock frequency of 25MHz, the internal core of this CPU executes at 50MHz for a 35% increase in performance compared to a 33MHz 486DX system.

Of course we're still serving your old favorites – the hottest PCs at the best prices on the market.

Browse through our other ad in *BYTE* for all the details about what's new from Gateway 2000. When you get the scoop, the decision to buy a Gateway will be easy as pie.

Where Can You Get The Best Byte For Your Buck?

While our competitors
talk about getting here.

At SunSoft, we're there.

Introducing Solaris.®

Why wait for some yet-to-be-delivered UNIX® knock-off where networking is an afterthought? New Technology is shipping today. It has a name: Solaris. The industry's only shrink-wrapped distributed computing solution.

The Solaris CD will put distributed computing on the world's most popular RISC and CISC platforms.

The Killer Environment

The 1980s was the decade of the killer application. The 1990s is the decade of the killer environment. Solaris. Based on SunOS, the most widely used 32-bit operating system, it will incorporate UNIX SVR4 and add symmetric multiprocessing and multithreading to turbo-charge mission critical applications. And with Solaris ONC™, the network is the computer. More than one million users have experienced the power of connecting to any computer—IBM, Apple, DEC, HP.

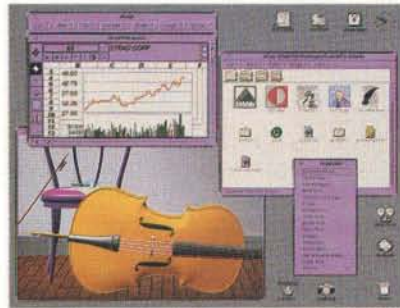

But Solaris doesn't stop there. It integrates the robust OpenWindows™ development platform. Empowering developers to create tomorrow's distributed applications today. Allowing applications to inter-operate—whether they are in the office next door or across the continent. Our present is their future. And our future is yours today. Solaris integrates an extraordinarily powerful framework for tomorrow's technologies that we call Project DOE—Distributed Objects Everywhere. A path that painlessly brings you to the future of computing. With Solaris, objects are closer than they appear.

So easy, it can't be UNIX.

Solaris: 32-bit. Virtual memory. Multitasking. Multivendor connectivity. Application interoperability. Adding this year SVR4, symmetric multiprocessing, multithreading and distributed objects. Imagine this power uniting the world's most popular SPARC and 80x86 computers in 1992. Imagine being able to access it—simply.

Imagine no more. Solaris puts all network resources at your fingertips graphically through the 3D OPEN LOOK® desktop metaphor. Magnified Help—on-line context-sensitive hypertext documentation—acts as your personal tutor. And Solaris adds DeskSet™, a suite of 15 workgroup productivity applications including Multimedia Mail with integrated voice and video capabilities and Workgroup Calendar which links groups and schedules across the world.

What's more, Solaris has all your favorite applications. Lotus 1-2-3, Ashton-Tate dBase, WordPerfect. More compatible solutions than any other 32-bit environment. More than 3600 in all.

Solaris combines 3D OPEN LOOK with your favorite applications.

To get there, start here.

A lot of companies talk about making distributed computing reality. Still more only dream about it. But at SunSoft, we've made it happen. So if you want to hear where distributed computing is going in the 90s, talk to some other manufacturers. But if you want to see where it is, call us. 1-800-227-9227

Because we're there.

INSIDE BYTE

ABOUT THE COVER

This month's cover was created by photographer Mark Rockwood in collaboration with ImageSet Design (Portland, ME). Three separate photos, a video camera, and a monitor and keyboard were scanned, color-corrected, and manipulated using state-of-the-art hardware and software from Scitex, Adobe, and Quark. Film was generated with an Agfa Selectset 5000 Imagesetter.

BYTE (ISSN 0360-5280/92) is published monthly with an additional issue in October by McGraw-Hill, Inc. U.S. subscriber rate \$29.95 per year. In Canada and Mexico, \$34.95 per year. European surface mail subscriptions \$50, airmail \$70. Non-European subscriptions, \$50 surface mail or \$75 airmail. All foreign subscriptions are payable in U.S. funds that can be drawn on a U.S. bank. Single copies \$3.50 in the U.S., \$4.50 in Canada. Executive, Editorial, Circulation, and Advertising Offices: One Phoenix Mill Lane, Peterborough, NH 03458. Second-class postage paid at Peterborough, NH, and additional mailing offices. Postage paid at Winnipeg, Manitoba. Registration number 9321. Printed in the United States of America. **Postmaster:** Send address changes, USPS Form 3579, and fulfillment questions to BYTE Subscriptions, P.O. Box 552, Hightstown, NJ 08520.

INTERNATIONAL SECTION
 begins after page 82

PC Magazine calls it "the ultimate-power desktop PC." What will you call your new ZEOS '486 *Editors' Choice* system? Probably the hottest computer you've ever owned! No matter how much power you're looking for, ZEOS has it for you.

ANNOUNCING THREE HOT NEW PROCESSOR OPTIONS: '486SX-25, '486DX2-50 AND '486DX-50!

Go ahead and Pick your Power! ZEOS gives you all the options. You can start out by taking a look at the de facto desktop power standard, the 386DX-33. Our '386-33 workhorse is a great entry point for true desktop power computing. But if it's a '486 you're after, hang on to your hat!

Upgradable.

Because you're off to a fast start with a 486SX-20 or our brand-new 486SX-25. The 486SX is like a 486DX without the built-in math co-processor. It's the easiest way to own the '486. And for full blown 486DX power, why not opt for your own *Editors' Choice* system!

It's the ZEOS *Editors' Choice*

486DX-33. Quite simply, there is nothing else like it. Go with the ZEOS '486 if you want the type of quality, performance and value that makes an *Editors' Choice* machine. And if it's 50MHz you've been dreaming about, dream no more.

Because right here, right now, ZEOS gives you the option of '486 50MHz power! We're talking power unlike anything you've seen before. Take either the ZEOS 486DX2-50 or the 486DX-50. Absolutely unbelievable *performance!* And the price? That's what you really won't believe; only a couple hundred dollars more than the ZEOS 486-33. *Amazing.*

AND THAT'S JUST FOR STARTERS.

Because ZEOS combines the high speed upgradable processor of your choice with some of the fastest DRAM made. Both

This "Ultimate-Power
Desktop PC" was chosen
Editors' Choice.

Here's why.

TAKE YOUR PICK!

Choose From 4 Great Money Saving Packages.

Or Specify Your Own Custom Configuration!

ZEOS COMPLETE SYSTEM PACKAGE #1

- The Processor and Speed of your choice plus future upgradability!
- 1MB of High Speed RAM, expandable to a system total of 32MB right on the motherboard.
- 42MB High Speed IDE hard drive with its own cache.
- 1.2MB or 1.44MB Teac® floppy drive.
- ZEOS 14" flat screen Hi-Res amber monitor with Tilt/Swivel Base.
- Shadow RAM and EMS support.
- ZEOS/RS 101-key SpaceSaver keyboard.
- Two Serial, one Parallel & one Game Port built right onto the motherboard.
- 7-16, 1-8 bit expansion slots.
- 80387 math coprocessor support for '386 systems.
- Rugged ZEOS SpaceSaver case with twin cooling fans for added reliability and product life.
- Seven drive bays and our custom 300 watt power supply with built-in surge suppressor!
- Includes ZEOS 24 Hour a Day Toll Free Technical Support and Customer Satisfaction Package.

INCREDIBLE ZEOS PACKAGE #2

We take Package #1 and upgrade your ZEOS Modular System to include:

- 2 full Megabytes of Rip-roaring RAM.
- Our incredible 107MB IDE hard drive with its own built in cache.
- Both the Teac® 1.2MB & 1.44MB floppy drives!
- Diamond SpeedStar Hi-Color VGA card/1MB RAM & Sierra DAC plus WinRIX drawing software!
- ZEOS 14" Hi Res VGA Mono Monitor with Tilt & Swivel Base.
- Lotus 1-2-3 for Windows, Ami Pro 2.0, *plus* Microsoft Windows and DOS 5.0, *plus* a genuine Microsoft Mouse!

INCREDIBLE ZEOS PACKAGE #3

Add even more memory, a larger drive. And more Savings!

- 4 full Megabytes of Ultra High Speed RAM.
- Our fast 130MB IDE hard drive with built-in cache.
- Teac® 1.2MB & 1.44MB FDD's!
- Diamond SpeedStar Hi-Color VGA card/1MB RAM (32,000+ colors) plus WinRIX drawing software!
- ZEOS 14" High Res 1024x768 Non-interlaced VGA Color Monitor w/ Tilt & Swivel.
- Lotus 1-2-3 for Windows, Ami Pro 2.0 with Adobe Type Manager, Microsoft Windows, DOS 5.0 *plus* a Microsoft Mouse!

PACKAGES 2, 3 & 4 INCLUDE LOTUS BUNDLE!

| | Pkg. #1 | Pkg. #2 | Pkg. #3 | Pkg. #4 |
|------------------|---------|---------|---------|---------|
| 386-33 | \$1395 | \$1895 | \$2395 | \$2895 |
| 486-SX20 | \$1595 | \$2095 | \$2595 | \$3095 |
| 486SX-25 | \$1695 | \$2195 | \$2695 | \$3195 |
| 486DX-33 | \$1795 | \$2295 | \$2795 | \$3295 |
| 486DX2-50 | \$1995 | \$2495 | \$2995 | \$3495 |
| 486DX-50 | \$2195 | \$2695 | \$3195 | \$3695 |

Add \$200 to any price for a 128K cache. 486DX-50 SpaceSaver case has 6 bays.

Lotus Software Bundle!

For a limited time only, order any ZEOS Windows system (like packages 2, 3 and 4 above) and we will also include Lotus 1-2-3 for Windows and Ami Pro 2.0— at no additional charge!

THE ULTIMATE ZEOS PACKAGE #4

Now, Memory goes to 8MB and the drive to 210MB. *PC Magazine Editors' Choice* as a 486DX-33 Vertical!

- 8 full Megabytes of High Speed RAM.
- Your screaming 210MB IDE hard drive with its own built-in cache.
- Teac® 1.2 & 1.44MB FDD's!
- Diamond Speedstar Hi-Color VGA card/1MB RAM (32,000+ colors) plus Win-

RIX drawing software!

- ZEOS 14" 1024x768 Non-interlaced VGA Color Monitor w/ Tilt & Swivel.
- Lotus 1-2-3 for Windows, Ami Pro 2.0 with Adobe Type Manager, Microsoft Windows, DOS 5.0, Microsoft Mouse!

Circle 141 on Inquiry Card.

ZEOS. Nine times Editors' Choice. Your Best Choice as Well!

are mounted on your ZEOS system board, one of the most advanced in the industry. And that's where your new system really begins to shine.

Because to this we add an *incredibly fast* IDE hard drive and genuine Teac® floppy drives. We have located the ports for these drives right on the motherboard along with your serial, parallel and game ports. The result? Two slots are saved giving your new ZEOS system a total of *eight*. All this while others

Low Cost.

are trying to get you to accept fewer slots. It's part of your ZEOS expansion advantage. The slots to expand, how about the room?

This is where ZEOS has performed something akin to magic. We call it our SpaceSaver case. Complete with *seven* drive bays (six with the DX-50), this incredible case is actually smaller than many cases offering only five drive bays. Plus, we've also added a *second whisper quiet cooling fan*. Why? Because the cooler a system runs the longer it will last. Now that's ZEOS Value.

Your new ZEOS system is absolutely loaded with features. Like our 300 watt power supply with *built-in surge suppression*. And, every ZEOS system is UL® listed.

And don't forget you're also receiving 24 Hour a Day Toll Free Technical Support, our 30 day Absolute Satisfaction Money Back Guarantee, Express Parts Replacement and more.

So go ahead. Pick your Power, your Package, and your Price and give us a call. Your friendly, expert ZEOS Systems Consultant is ready to answer any questions you may have. **Call Now Toll Free 800-423-5891.**

ZEOS SYSTEMS— A FEW EXPERT OPINIONS:

PC Magazine,
"Out of 104 machines from 58 companies...For Overall Excellence we selected ZEOS International..."

InfoWorld, "We find the ZEOS '386 an excellent value. Speed: Excellent. Compatibility: Excellent. Value: Excellent."

Government Computer News,
"Arguably the fastest MS-DOS and OS/2 micro in the world."

PC Magazine,
Editor's Choice,
"The ZEOS blows away every other computer...a smart choice."

SUBMISSIONS

Authors: We welcome article proposals and
submissions. Unacceptable manuscripts
will be returned if accompanied by sufficient
return postage. Not responsible for lost
manuscripts or photos.

Vendors: We welcome news of your new
products; please call the News department
or the BYTE Lab at the earliest possible
date. We cannot be responsible for unso-
licited product samples.

SUBSCRIPTION CUSTOMER SERVICE

Inside U.S. (800) 232-BYTE; outside U.S. (609)
426-7676. For a new subscription—(800)
257-9402 U.S. only, or write to BYTE Sub-
scription Dept., P.O. Box 555, Hightstown,
NJ 08520. Subscriptions are \$29.95 for one
year, \$54.95 for two years, and \$74.95 for
three years in the U.S. and its possessions.
In Canada and Mexico, \$34.95 for one year,
\$64.95 for two years, \$87.95 for three years.
In Europe, £29 (U.S. \$50) for fast surface
delivery, £41 (U.S. \$70) for air delivery. Non-
European countries U.S. \$50 for surface
mail, or U.S. \$75 for air mail. Single copy
price is \$3.50 in the U.S. and its posses-
sions, \$4.50 in Canada. Foreign subscrip-
tions and sales should be remitted in U.S.
funds drawn on a U.S. bank. Please allow
six to eight weeks for delivery of first issue.

All the benefits of a laser printer

A size

DESKTOP CONVENIENCE
RELIABILITY
LOW COST
SHARP, HIGH QUALITY OUTPUT
FAST PRINTING SPEED
PLAIN PAPER

At last. A personal output device that combines the best features of a desktop laser printer with the ability to produce large C-size drawings. It's called ProTracer — a monochrome ink jet printer/plotter designed for the personal use of PC CAD professionals.

MEDIA FLEXIBILITY

ProTracer is a desktop printer/plotter that lets you produce A, B, as well as large C-size output. It prints sharp, precise lines on a variety of media including plain and bond paper, plotter paper, and vellum.

SPEED

ProTracer is fast and quiet because it uses the latest inkjet technology and an Intel i960 processor. Just compare it to any other large format plotter

and you'll see. A complex C-size drawing often takes over half an hour on a pen plotter, while ProTracer completes the same drawing in only five minutes!

HIGH QUALITY OUTPUT

ProTracer achieves its high quality output by utilizing a 64 nozzle printhead to deliver crisp lines and bold, high contrast blacks. Its 360 dpi resolution assures sharp lines needed for everything from the most complex engineering drawings to sophisticated text and graphics used in letters and reports.

VERSATILE AND EXPANDABLE

Unlike other large format devices, ProTracer isn't limited to plotting. Instead, it can produce high quality finished output for a variety of

On a much larger scale.

PEN-INPUT SYSTEMS

**Despite all the hoopla
about pen-input systems,
is the world ready
for them?**

Most of the excitement about pen-based computers is unwarranted. Industry gurus have been cheerleading for pen technology for well over a year, and even we carried a cover story last November on the Momena, which promised to replace the traditional notebook computer. Yet those who are building these machines have not been deluged with orders. The reason is that pen-based systems

are too expensive, don't deliver all the functionality needed, and require too much training.

Two paradigms get most of the attention for pen computing. In one, a pen-based system might replace the notebook computer. That is the approach taken by Momena.

The trouble is that a notebook computer is a moving target. Currently, notebook makers are transforming their products into do-everything, portable replacements for desktop systems with color, lots of power, and lots of memory and disk space.

And as if to prove once and for all that a notebook can replace a desktop system, some makers are building desktop "docking stations" to contain the components and add-in cards that don't happen to fit into the notebook itself. Then there's the whole issue of color. How can a notebook replace a desktop system if it doesn't offer high-quality color at a reasonable price? Add to all that the complexity of a pen interface and handwriting recognition, and you have a complicated piece of machinery that even NASA can't afford to build.

The other paradigm is pen computing as an adjunct to existing computers. Consider a small, highly portable computer that literally replaces a pocket-size paper notebook. The idea is that instead of writing notes on paper to later transcribe into your computer, you would simply "write" those notes on the pocket-size pen computer and later transfer that information to your desktop system.

That makes a lot of sense, but there's still one problem: The technology just isn't there yet. Building a pen system to fit into a coat pocket is not too difficult, but packing in enough power to do handwriting recognition—and remain reasonably fast—is a major hurdle for manufacturers to overcome. There's no easy way to pack, say, an alkaline-battery-powered 486 CPU with lots of memory and storage and a pen screen into a 10-ounce package that fits in your coat pocket.

Even if the engineers could, I'm not sure that you'd

want to take the time to train it. Handwriting-recognition technology just isn't good enough to deal with everyone's handwriting style, so you have to teach the system how *you* write each letter of the alphabet. Even after training, most pen systems expect you to change the way you write to improve the odds of recognition.

Maybe that wouldn't be so bad if the odds weren't stacked against you. The fact is that most systems ask you to rewrite many characters so that they can be recognized. Isn't this the reason that voice recognition never caught on? If you ever sat in front of a microphone saying "Enter" over and over again instead of just hitting the Enter key, you know what I mean.

This may all sound as though I don't like the idea of pen computing, but that's not true. What I want to see is a pen-based system that truly makes sense. It wouldn't have to fit into my coat pocket, but it would have to be light—under 2 pounds. It would also have to come in a form with which I'm used to working—roughly the dimensions of a sheet of paper and no thicker than a pad of paper. I don't want to give up anything I can do on paper.

My ideal pen-based system would also run all day before recharging if it used rechargeable batteries, or several weeks before replacing the batteries if it used alkaline batteries. It would also have the power and performance to recognize my scribbly, inconsistent handwriting with perfection, and it would do it so fast that I'd not be particularly aware that it was happening.

Most important of all, it would be connected to my desktop system and my office network, so that I could access any information I need when I need it. It could use a wireless LAN when I'm in a conference room at my office building or a cellular connection when I'm away. And, finally, my system would cost only about \$2000.

Unfortunately, my ideal system isn't available, and the current offerings don't even come close. When it does become available, you'll probably find it on the cover of *BYTE*. So the real question is whether pen computing is ready for the world. Except for a few special applications, such as electronic forms, the answer is no, not today.

Introducing Quattro Pro 4.0 The only DOS spreadsheet with pushbutton power!

**Borland does
it again—
Sorry, Lotus!**

No other DOS
spreadsheet
gets your work
done faster than
Borland's new

**NEW
SpeedBar**

Quattro Pro's customizable, built-in
SpeedBar™ is a row of clearly
labeled buttons that use simple
English commands to give you
instant mouse-click
access to your frequently
used features and macros.

Plus you get immediate access
to a host of new features.

Intelligent Graphs let you perform
extended analysis with your graphs
without changing your data. And
Quattro Pro's Optimizer™ allows you
to solve complex problems using
multiple variables.

The best spreadsheet on networks

Only Quattro Pro 4.0 gives you superior
Novell NetWare support, including
automatic logon, drive mapping and a
new Print Queue Manager.

The most feature-packed DOS spreadsheet ever!

And in addition to Quattro Pro 4.0's
dramatic new advances, you get the
features that have made it the #1-rated

spreadsheet in the world. Features such
as WYSIWYG, Print-To-Fit™
spreadsheet output, superb
1-2-3® compatibility (you can
even read Allways, Impress and
WYSIWYG files) and more.

Top-rated spreadsheet Top-rated company

Quattro Pro has won more awards for
technical excellence and customer
satisfaction than any other DOS
spreadsheet. And J.D. Power and
Associates ranked Borland "best
application software in customer
satisfaction in Small to Medium-
sized and Large Businesses."

Now you know why more than one
million people have upgraded to the power
of today's spreadsheet. Quattro Pro.

Attention 1-2-3 users!

Step up now!

Circle 49 on Inquiry Card (RESELLERS: 50).

IN A CATEGORY OBSOLETE AND LIGHTER, COMPAQ WINS ANOTHER ADJUDICATION

Make it smaller. Make it lighter. Make it lighter. Make it smaller.

These must be the mandates emblazoned upon every R&D document handed to the engineers of today's crop of notebook computers.

Admirable goals to be sure. Goals that the engineers at Compaq, however, believe fall well short of making the most of portable computing.

Accurate to within minutes, the COMPAQ Power Smart Pack battery gauge clearly displays remaining battery life at the touch of a button.

Which explains why the latest 386SL notebook technology from the labs in Houston — the new COMPAQ LTE Lite/25 and LTE Lite/20 PCs — are not only the lightest (a scant 6 lbs.) and the smallest (only 8.5"x11"x1.75") notebook PCs that we've ever built. They're also the smartest.

The COMPAQ Hibernation feature saves all open files to the hard drive and turns the unit off, either upon request or as an automatic feature. Power up the COMPAQ LTE Lite later and you're back exactly where you left off.

THE BRAINS BEHIND THE OPERATION.

When it came time to design a new notebook, we started (logically enough) with the battery.

The new COMPAQ Power Smart Pack battery in our new notebooks delivers up to 4.5 hours of computing, a full hour longer than most.

A microprocessor inside the battery itself monitors current usage levels and continually calculates the available power remaining.

It can even instruct the notebook to save all open files to the hard drive should the battery power run too low.

And the energy-saving features in our newest notebooks go far beyond the presence of an Intel 386SL chip.

To make the most of the smarter battery, the new COMPAQ LTE Lite also comes with user-adjustable power-drain settings, and three dif-

ferent sleep modes — System Idle, System Standby, and Hibernation.

A MOST MODERN MODEM.

Our optional 9600-bps modem for the COMPAQ LTE Lite PCs would make even Alexander Graham B. proud.

The COMPAQ Enhanced 9600-bps

Internal Modem is compatible with the broad base of today's communications protocols.

Just slip the COMPAQ LTE Lite into the COMPAQ Desktop Expansion Base and you're instantly connected. Expansion slots, external ports, and mass storage bays give you immediate access to monitors, networks, hard drives, tape drives, CD-ROM and more. And all the while built-in security features ensure a safe harbor for your notebook.

In modem talk, that means true V.32 9600-bps data transmission and V.42bis compression for up to 38.4 kbps throughput, as well as full support for Hayes AutoSync.

This little marvel negotiates the fastest transmission throughput that the other end of the line can muster, whether it's sending or receiving.

It even drops to a low power-drain standby state and monitors incoming signals if you're waiting for a call to come in.

Or for that matter, another modem to catch up. **NOT ONLY SMART, BUT BRIGHT.**

The new, efficient COMPAQ Maxlight VGA display makes for a much brighter screen than our previous notebooks, and does it without sacrificing battery life.

Sharper graphics and text in up

DESIGNED WITH SMALLER WOULD LIKE TO SUGGEST EFFECTIVE: SMARTER.

to 64 shades of gray complement an enhanced video subsystem that's so fast it virtually eliminates "submarining," better known as "where did that #%\$**# cursor go?"

A NOTEBOOK THAT'S USELESS IN THE WRONG HANDS.

At Compaq, we realize that data security is every bit as important as hardware security.

At the hardware level, DriveLock locks the hard drive, preventing access to data even if the drive is removed.

One-touch QuickLock and QuickBlank functions

Isolated inverted "T" cursor controls are in a familiar position so you don't have to teach your fingers new tricks.

allow you to quickly (surprise) disable the keyboard or blank the screen.

And of course, our new notebooks come with a Keylock slot for an optional cable lock.

With all of the above, plus a 120-MB hard drive,* RAM expansion to 10 MB, cache memory, simultaneous display, and an auxiliary battery, to say these are the best notebooks we've ever made would be something of an understatement.

To back them with a one-year worldwide warranty and our toll-free Compaq Customer Support Center hotline would be more like it.

So don't choose between a small notebook and a smart notebook. Choose both.

Choose the new COMPAQ LTE Lite. For information about our new notebooks or an Authorized COMPAQ Reseller near you, call Compaq in the U.S. at 1-800-231-0900, Ext. 100, or in Canada at 1-800-263-5868, Ext. 100.

COMPAQ

Actual weight: 6 lbs. Actual dimensions: 8.5"x11"x1.75". Actually, this is the best notebook we've ever built.

APL Praise

It was refreshing to read Doris Appleby's "Classic Languages, Part 4: APL" (December 1991). APL deserves much more serious attention both from expert programmers and from managers with difficult problems to resolve.

APL has been described by James Martin as the only language worthy of being called a fifth-generation language. Ironically, it is also one of the oldest languages. APL is the only fully international language, precisely because of its special character set. It is the only language that has been devised for people first and then converted to machine use.

Because of its power, the scope of APL is almost certainly far wider than that of any other language. This power makes it unequalled in fields, such as actuarial mathematics, statistics, and operations research modeling, where common languages are terribly cumbersome and tedious to use. This power is equally evident and just as useful in business when there is need for resolving complex questions in a hurry and for adapting to ever-changing conditions.

Georges Brigham
Wilton, CT

Great Road Maps

The article "Distributed Open Environments" (November 1991) is the best I've seen on the subject.

Soon every personal computer will be part of a global network. We need road maps, and we need to know the traffic rules, the rule makers, and the rule-making groups, as well as the products, construction/configuration/architecture, and management techniques. Articles like this are the reason I subscribe to BYTE. Don't spare the detail, and keep up the good work.

George McKee
Houston, TX

More on OS/2 2.0

Jon Udell's "OS/2 2.0: A Pilgrim's Journey" (December 1991) raises more questions than it answers.

First: Where's the software? My favorite mail-order house advertises a hundred products for Windows and not one for OS/2. Did Udell use any OS/2 applications? He doesn't mention any. He says that "potent" OS/2 software "waits in the wings," as has been said since 1987. Meanwhile, as the curtain rises on OS/2 2.0, Lotus uses a four-page color foldout inside BYTE's front cover to tell us about 1-2-3 for Windows.

Second: If OS/2 is a "better DOS than DOS," why is there a multiple boot facility? Substitute "DOS 5.0," a

truly better DOS, in place of "OS/2" in one of Udell's remarks and see how it reads: "Even the most partisan DOS 5.0 users occasionally need to boot plain old DOS 3.3." Udell goes on to call the multiple boot facility "one of OS/2 2.0's nicest features." If you found that DOS 5.0 users always keep DOS 3.3 ready on their disks as well, would you accept that as anyone's idea of a "better DOS than DOS"?

Third: Exactly how much does it cost a Windows user, in extra RAM and disk space, to run OS/2? Even if Windows applications run just as well, OS/2 is not "a

better Windows than Windows" if it takes more resources to do the same job. Underneath a lot of technospeak about VDM and DPMI, I think that Udell is telling us that it takes a lot more. Windows applications ran "fine" on his 12-MB Systempro but "poorly" on his 4-MB Swan. Yet 4 MB is twice what vendors ship with their "Windows-ready" PCs.

Finally: Will IBM really support OS/2 on non-IBM hardware? When Udell wrote in April 1990 ("OS/2 2.0: It's a Family Affair") that OS/2 2.0 was the system he wanted, it was backed by Microsoft. Now it's in the hands of a hardware vendor whose ads for years suggested that OS/2 required the Micro Channel to run reliably. IBM's current ads don't say that—but they say nothing at all about what machines it will run on or who will provide the software support. Udell succeeded in running OS/2 on his Swan and his Systempro, but I would like to know if this is just an experimental observation, or if IBM certifies and supports it for those platforms. How does the OS/2 list compare with Microsoft's list of nearly 200 platforms that support Windows?

Daniel P. B. Smith
Norwood, MA

"Where's the software?" Although your mail-order house may not prominently advertise the fact, OS/2 versions of many of the most important Windows (and DOS) applications exist. I run OS/2 versions of Smalltalk/V, PageMaker, Epsilon, and HyperAccess, for example, along with OS/2-only gems like the Hamilton C Shell. Of course, that's just the icing on the cake. OS/2 2.0 subsumes nearly all existing DOS and Windows programs, so the answer to your question will be "everywhere" if 2.0's Windows support turns out as well as its DOS support has.

As to multiple boot, it's just plain useful. As a developer, I'd love to be able to use a single machine to test my application under DOS 3.3, 4, and 5, as well as OS/2 1.3 and 2.0. And note that the multiboot feature isn't just a way to fall back to DOS—you can use it to toggle between OS/2 and Unix or other operating systems. Now that you mention it, yes, I think multiple boot would be a nice enhancement to DOS 5.0 as well.

How much extra RAM? As I mentioned, the Windows support in the early version of OS/2 I tested did not yet successfully exploit OS/2's memory manager. Clearly, that's critical. Windows can't be said to run well under OS/2 unless it can perform on a 4-MB machine. Will it? The jury's still out. Note, however, that OS/2 and DOS

WE WANT TO HEAR FROM YOU. Address correspondence to Letters Editor, BYTE, One Phoenix Mill Lane, Peterborough, NH 03458, or send BIXmail c/o "editors." Your letter may be edited for length and clarity.

Imagine:

interface development & screen management in a utopian environment!

In the perfect world, you probably wouldn't choose to spend excessive time and energy (read: any) sweating the interface to satisfy the constantly changing whims of your end-users. On the other hand, the perfect world wouldn't *have* end-users.

But the real world does.

And the more difficult, picky, and fickle they get about how their screens look and function, the more likely it is you're going to want to change careers.

Vermont Views™ v3.0

Fortunately, we can end your end-user nightmares — whether you're developing for UNIX, DOS, VMS, or all three! Vermont Views takes the aggravation out of coding and recoding perfect C language interfaces. Instead, we let you create sophisticated screens *interactively*, with our program's powerful, intuitive, menu-driven Designer.

With the Designer, you can create window-based data-entry forms that have tickertape and memo fields, pushbuttons and radio buttons, scrollable form regions, choice lists, scroll bars, shadow borders, and more. Just peruse, choose, and there they are!

Changes? Easy! New details? No problem! Whole new approaches? Go for it!

In fact, there's almost nothing you *can't* do, because Vermont Views is backed by an incredible library of 586 tested, debugged, reliable functions. Which means that every screen you create can look and run distinctively, uniquely, and precisely the way you need it to.

Of course, the real beauty of Vermont Views may be the easy portability among DOS, UNIX, POSIX, XENIX, and VMS. That you can use it with Oracle, Informix, db_Vista, Sybase, Btrieve, C-tree — or any

database that interfaces to C. Or run it on IBM, NCR, DEC, HP, AT&T, and all the others. How come? Because Vermont Views functions *independently* of operating system, database, and hardware. And we supply shrouded source, so you know you'll be able to move applications to *any* desired platform — without paying runtime fees or royalties.

Which isn't to say that Vermont Views' portable interfaces are restricted in capability. Anything but! Our DOS interfaces have *everything* that *anyone* has imagined — including full mouse support. And our terminal versions have the fastest screen updates in the business. How fast? Don't bother reaching for the Twinkies. *That's* how fast.

Now take that blinding execution speed, that fourth generation language convenience, that power and flexibility, and top it all with great documentation, superb tech support, seven years of developer input... and immediately, one fundamental question leaps to mind: Why are you still letting your end-users whack your fragile head against their hard, heartless walls?

Join our thousands and thousands of happy, healthy customers. Take that big step towards developer's dreamland.

Circle 133 on Inquiry Card.

The award winning T2200SX

If you need any more power than this

If your desire for power is on the scale of say, Louis XIV, consider the Toshiba T2200SX. Weighing a mere 5.5 pounds and taking up just half a briefcase, it possesses an awesome 20 MHz 386SX microprocessor and a 40, 60 or 80 MB hard drive with 2MB RAM expandable to 10 MB. And it's powerful enough to have grabbed both a PC/Computing MVP award and a PC Magazine Technical Excellence Award.

The new T3300SL

maybe you should get into politics.

If your need for power is on the scale of say, Napoleon, consider the new T3300SL. It offers a 25MHz 386SL microprocessor plus 64 KB cache for blazing speed and longer battery life. Not to mention an 80 or 120MB drive and a PCMCIA-compatible slot. And like its cousin the T2200SX, it offers a Nickel Hydride battery and a carbon-fiber reinforced case. So call 1-800-457-7777. Or if you want even more power, don't forget it's an election year.

In Touch with Tomorrow
TOSHIBA

applications do quite well on a 4-MB machine.

And what about clone support? I don't have an official list from IBM, but an unofficial one is available on BIX (see the file CLONES.ZIP in ibm.os2/listings). Among the 386/486 systems that have successfully run both OS/2 1.x and 2.0 are those made by Northgate, Gateway, Everex, Compaq, CompuAdd, Dell, Tristar, Cheetah, Arche, Ergo, Acer, Hewlett-Packard, and Zeos. These systems sport hard disk subsystems with RLL, ESDI, and IDE interfaces (yes, SCSI support is still weak); BIOSes from AMI, Award, Compaq, and Phoenix; display adapters by Video Seven, ATI, Boca, Paradise, and Trident. Yes, high-resolution/deep-color drivers are few. But most observers have been pleasantly surprised by 2.0's promiscuity. —Jon Udell

No Longer Unthinkable

Dick Fleming's "Think About the Unthinkable" (November 1991) was right on the money. I work in an office where we are going through computer-literacy growing pains. Most of our people use computers only because they have to, and they tend to put in only the minimal amount of time to learn about them. I often get on a soap box about backing up files and documenting activities and procedures.

I would add to Fleming's list a screen dump of the system setup menus. Ours got changed by some unwitting soul, and because we didn't have a copy, we had to call the manufacturer for the hard disk data values.

Fleming says that if you take the time to think about the unthinkable, "someone may be grateful that you did." Well, if you have a hard disk failure and have to rebuild your system, you might be the one who'll appreciate the data recovery notebook that Fleming advocates.

Evaluating Standards

Eric S. Raymond's "Standards Everywhere" (January) raises some important issues associated with the increasing growth of "open" standards and economic and technical cartels. Unfortunately, some of his arguments and conclusions are poor at best.

In an attempt to describe the proliferation of standards, he cites "ACE versus SPARC versus EISA versus PS/2. X Window System versus News versus Display PostScript. And GUIs. Don't even talk to me about GUIs." These comparisons are incorrect because they do not represent entities of the same class: ACE is a cartel; SPARC is a RISC definition; EISA is a bus standard; and PS/2 is a brand of IBM PC. A better comparison might be ACE versus Sun (or SPARC, Inc.) versus Apple/IBM versus 88/Open. The X Window System is a drawing engine and a crude GUI even without Motif or Open Look—so he has broken his rule about not talking about GUIs. Network Extensible Windows System (News) is display PostScript; News is an example of a failed standard, as Sun is one of the last to support it.

Open standards come from various beginnings, but most are seeded by an economic need to reduce the rate of change for the item being standardized. This is an at-

tempt to reduce software life-cycle costs. Today most new hardware systems have a half-life of 18 months, yet the government and some large businesses can't get the specifications for new software out in less than 12 months. Coupled with an economic need for 10- to 20-year life cycles (with technology infusion every so often), the computer industry is becoming very strained.

Standards slow the rate of change, allowing users to keep up to date with technology without massive costs. Major standards do tend to take longer to be approved or to change than one would like to see, but standards force industry to serve users, not sellers.

I agree with Raymond that any standard with more exceptions than rules should be shunned. I do not agree with his Rules for Standards Survival. Rule 1 states that you should wait to commit to a standard until everyone else also appears to commit. If you do that, you are likely to be left out in the cold. Rule 2 warns you not to honor a standard if it's dictated by a single entity. This is true in most cases; however, if the government is that entity, you may be right only half the time. Rule 3 states that the bigger the standard, the less its value. For an example of why this is wrong, look at Ada. It's a small standard, yet it lacks the elegance that Raymond says he values.

Humans vs. Machines

I enjoyed Ben Smith's "The Dangers of Multitasking" (December 1991). However, with the greatest respect, I suggest that he has got the hierarchy of computers and humans upside down.

To my mind, the core of human communications is the dynamic modeling of all the other participants and then the recursive modeling of oneself, and everyone else, within that model, all updated in milliseconds at critical points in a discussion. This is an exquisitely intricate affair, involving as it does the feelings and relationships of those involved, over and above the technical matters under discussion.

The issue has wider importance when viewed from a sociological point of view. Just as Smith fears, I believe that our technical tools imperil our society by trivializing our behavior.

Suffice it to say, I am impressed that these aspects of technology are getting exposure in such a technically oriented journal. Keep up the good work!

FIXES

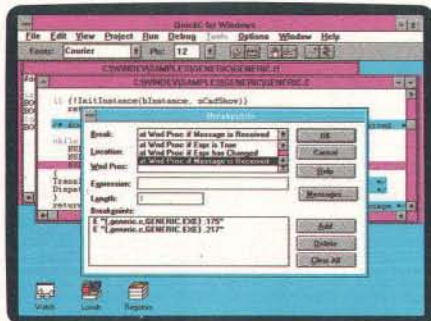

- In the February First Impressions (pages 39 and 47), we neglected to swap three high-resolution images for low-res. We apologize to Farallon Computing, Inc., and Microsoft Corp.
- The GXtra/W SBus card from Tech-Source (February, What's New, page 54) comes with a keyboard and a mouse port, not a keyboard and a mouse. ■

Graphic proof that developing Windows apps is now easier.

Use QuickCase:W to draw the graphical elements of your Windows program, from menus and dialog boxes to cursors and icons. Then, let QuickCase:W generate commented expert-level C source code for the design that you've created.

QuickC for Windows supports a wide range of breakpoint types, from breaking at a location to breaking on a Windows procedure when a message is received.

Take a look at Microsoft® QuickC® for Windows™. It's Windows-hosted, so you can edit, compile, and debug inside a single environment. Click on the Toolbar™ to choose frequently-used functions, from changing fonts to setting breakpoints. Workspace templates let you save your screen layouts, so you can reload them quickly from another session.

Plus, a remarkable tool known as QuickCase:W lets you create every element in your user interface with a few strokes of a mouse. Then it automatically generates the C source code you need.

All of which lets you create more applications. And more kinds of applications: C programs that call Windows APIs, graphical front-end programs for FORTRAN and COBOL, and C DLLs for other programs.

We suggest a visit to your Microsoft dealer. Because with QuickC for Windows, seeing is believing.

PROGRAMMER'S TIPS

Key Features

- Windows-hosted integrated development environment including an editor, compiler, and debugger.
- All you need to write a Windows-based program.
- QuickCase:W generates source code from your program design and regenerates the code if you change the design.
- Wide range of breakpoint support, including breaking at a location, breaking when an expression has changed, and breaking at a Windows procedure when a message is received.
- Complete printed and online documentation on the Windows API.
- Toolbar for quick access to frequently used editing and debugging functions.
- Save Workspace and Load Workspace for saving and restoring window positions and breakpoints.
- Syntax highlighting in editor.
- Customizable tools menu allows you to run any Windows or DOS* program from within the QuickC for Windows environment.
- QuickWin library for converting well-behaved C programs for DOS to Windows programs.
- Generates Windows Executables, Windows Dynamic Link Libraries, QuickWin Executables for the Windows environment, and MS-DOS* Executables.

- To rebuild your character-based DOS applications to run under the Windows environment, select the "QuickWin EXE" Project type in the Options menu.
- Use the new and improved Dialog Editor to quickly and easily design dialog boxes for your programs.

Recently, VARBUSINESS conducted a survey of some people who know more about spreadsheets than anyone.

The people who sell, install, and support them for a living. The

survey asked hundreds of spreadsheet dealers and

resellers all kinds of questions to find out what the pros rate as the best spreadsheet. And the pros told them.

CA-SuperCalc®

In virtually every category from ease-of-use to technical support, CA-SuperCalc was rated higher than Lotus® 1-2-3® and Microsoft® Excel.

We're not surprised. While Lotus and Microsoft have been fussing over their many different spread-

sheet versions, we've been stuffing one spreadsheet, CA-SuperCalc, with everything you would ever want. From spreadsheet linking to 3-D graphics and beautiful, presentation-quality output,

CA-SuperCalc has it all.

And it runs on just about any PC.

But the best part is the price. At \$149.00, CA-SuperCalc costs less than half the price of Lotus 1-2-3 and Excel. Heard enough? Call 1-800-CALL CAI today for the name of the nearest dealer where you can buy the best spreadsheet there is.

If you're willing to spend a couple hundred dollars less.

COMPUTER ASSOCIATES®
Software superior by design.

Next to Step into the 486 Arena

Kicking off the first NextWorld Expo in San Francisco, Steve Jobs, president and CEO of Next, confirmed the long-standing rumor that Next will supply its NextStep interface and software development environment on the Intel 486 platform. The entire operating system—the same Mach version of Unix used on the Next platform—will be ported.

Rumors circulated at the show that Jobs would announce licensing deals with Compaq and Dell, but Jobs would only say that Next is negotiating licensing agreements with several manufacturers. Nevertheless, Next demonstrated alpha versions of NextStep 3.0 running on both Dell and Compaq 486 machines during Jobs's presentation and on the show floor. Jobs emphasized that the Intel port in no way affects the company's intent to compete in the hardware marketplace.

NextStep for the 486 will be available in a shrink-wrapped version directly from Next, with an end-user version priced at \$995 and a full developer's version priced at \$2495. Both versions are essentially identical to their Next computer counterparts. Jobs said that a beta version of NextStep for the 486 will be ready in the second quarter of this year and that a production version will ship in the third quarter.

Jobs claimed that NextStep is catching on in corporate U.S., Japan, and Europe as the premier tool for custom software development, particularly for "in-house, mission-critical custom applications." Jobs said NextStep's object-oriented development environment, Display PostScript imaging model and graphical interface, and Mach multitasking Unix kernel are technically superior to any of the competition's.

"We're three to five years ahead of Solaris, Windows NT, and Taligent," boasted Jobs. Jobs claimed that Next is getting more opportunities to compete with Sun Microsystems for volume sales deals and is "winning 80 percent [of them]."

The problem is that NextStep's advantages are not readily apparent to end users. While software developers find NextStep attractive, they are reluctant to invest in it unless they can see a large installed base of users. Whether NextStep on the 486 can turn things around remains to be seen.

—Nicholas Baran

Quorum Converts Mac to RISC, Provides Latitude over PowerPC

Quorum Software Systems (Menlo Park, CA) is developing a software porting system that helps developers turn Mac System 7.0 programs into native implementations on SPARC, IBM RISC System/6000, and Silicon Graphics Iris Indigo RISC workstations. Quorum's Latitude system maps Mac system and user-interface calls to the native calls of the target platform. The porting system, slated for release in June, lets developers reach an unprecedented number of platforms with a single instance of source code.

Silicon Graphics and SunSoft officials expressed delight at seeing Mac applications migrating to their platforms. But Latitude provoked quite a different attitude from at least one Apple official. Roger

Heinen, vice president and general manager of Apple's Macintosh Software Architecture Division, sat quietly in the audience as he watched Latitude's unveiling at the UniForum trade show and said only that he could not comment.

Quorum's product was previewed at the MacWorld Expo. At that show, Mac software was shown running blazingly fast on an Indigo workstation.

One possible reason for Heinen's muted response is that Apple may have entered into its alliance with IBM mainly in the hope of seeing the Mac integrated into the RISC world on the PowerPC. Quorum Latitude appears to do now what the PowerPC will do in 1993 or 1994.

—Ellen Ullman

NANOBYTES

Canon plans to distribute a kanji version of **NextStep 3.0** in Japan. Reports in the Japanese press also indicate that Canon will port a Japanese version of NextStep for the 486 to its 32-bit PCs. □

A major revision to the NextStep interface and development environment is scheduled to ship in June. In the networking arena, NextStep 3.0 will include built-in Novell NetWare and AppleShare protocols, which will allow seamless networking to PCs and Macs and to Unix workstations that support NetWare. Version 3.0 will include support for PostScript Level 2 and the **RenderMan 3-D** development specification. NextStep 3.0 also includes two long-awaited features: object linking and a database toolkit. □

In the keynote speech of January's Usenix conference, **Mitch Kapor**, founder of Lotus Development and more recently the chairman

of On Technology, discussed the commercial access and use of the **Internet** network, which is dedicated to research and educational use. The Inter-

net is becoming increasingly commercial, raising the same types of questions first asked about TV during its infancy, such as who is going to own it and who is going to control it. Before TV became popular, everyone thought that it would be the uplifting factor that would raise our culture from ignorance and apathy. Of course, that's not quite what happened. Kapor pleaded with his listeners not to let the Internet end up like the "vast wasteland of TV." □

Now you can and not get

Introducing new RISC System/6000 POWERstation

If you're interested in open systems but don't want to suffer the slings and arrows of outrageous prices, IBM is about to hit you where you live. The RISC System/6000™ POWERstation 220 gives you more wallop for your money, while delivering a hefty 25.9 SPECmarks.™ That's compared to the SUN IPC's™ 13.4 SPECmarks and the DEC5000's™ 17.8.

| Model | Entry Grayscale Workstation** | Entry 8-bit Color Workstation† |
|------------|-------------------------------------|--------------------------------------|
| IBM 220W | \$7,185 | \$9,995 |
| HP 705/710 | \$8,415 | \$14,065 |

Scientists see stars. CASE users can start with a grayscale workstation with a paging disk for just \$7,185. If it's CAD clout you're after, you can get a workstation specially outfitted for mechanical design—with 2D color graphics and 400MB of fixed disk storage—for only \$9,995. All models in the POWERstation 220 series come with two expansion

get more clout, clobbered.

and POWERservers that pack more punch for less.

slots and upgradable components. And industry-standard memory upgrades and add-ons for both are affordable, so growing won't be a pain.

Striking a blow for business. The POWERserver 220 is great for commercial UNIX® solutions, too. You can configure it as a commercial server, to give your business the speed, muscle and openness of UNIX, for only \$9,715. And the POWERserver 220 is as expandable as all our other models.

IBM is in your corner. Nobody else delivers the knockout support of IBM. An IBM customer engineer can install your

machines, configure your network and integrate all your systems, whether they're made by IBM or not. And IBM Credit Corporation has flexible financing packages to meet your needs. Get hit with the details. Call your IBM marketing representative or Business Partner. For literature, call 1 800 IBM-6676, ext. 769*.

And, for those who decide to shop for UNIX solutions elsewhere, a word of advice. Duck.

**The RISC System/6000
For the Power Seeker.**

Rambus's New Memory Architecture Could Put More Video PCs on Desktops

Rambus, a start-up company backed by three venture-capital firms and stocked with a stable of technical engineers, has developed a DRAM architecture and chip-to-chip data transfer technology that could solve the classic memory bottleneck problem. Geoff Tate, president and CEO of the Mountain View, California, company, said that the Rambus interface standard can be directly implemented on CMOS DRAMs, memory controllers, processors, graphics/video chips, and other components.

Tate said that Rambus's solution will deliver a tenfold increase in component throughput. A single Rambus DRAM (RDRAM) delivers up to "500 million bytes per second on a standard PC over a narrow, high-speed bus," he said. The company expects to capture more than 50 percent of the DRAM market by 1997. Tate adds that the company's solution uses fewer ICs and a modular system.

The problem Rambus addresses is well known to systems designers: The data transfer rate of memory ICs lags behind a processor's ability to handle data. Although DRAM densities have increased, DRAM performance has improved only marginally. Because of this, systems designers have resorted to complex workarounds of the bottleneck by using multilevel memory hierarchies, with Level 2 static RAM (SRAM) caches and cache controllers. And as display resolutions increase and customers clamor for true color, costs are driven up due to the memory needed to supply pixels at a high rate for a flicker-

free display. Animation graphics and video also require high data transfer rates to display images in real time. All these requirements have resulted in complex architectures that use specialized multiport DRAMs or video RAMs (VRAMs) to maintain the high data transfer rates.

Rambus replaces all these subsystems with a solution made up of masters, slaves, and a narrow, high-speed bus. Rambus engineers have developed a bus that's 1 byte (9 bits) wide and capable of transferring data at 500 MBps by using both edges of a 250-MHz clock. Masters and slaves connect to the printed-circuit board via a simple 32-pin interface. Small signal swings replace conventional, noisy TTL signals and operate in a controlled-impedance transmission-line environment, the company says.

Rambus says that its design will eliminate the need for Level 2 SRAM caches, cache controllers, and today's VRAM. Toshiba, Fujitsu, and NEC have already agreed to become Rambus interface licensees.

Tate predicts that RDRAMs will enable designers to jump from 8-bit VGA 256-color palettes to low-cost 24-bit true-color graphics. But he admits that there are still barriers to the Rambus vision. "You're not going to do animated graphics on today's monochrome displays." Nevertheless, Rambus may provide a solution that will accelerate the progression toward true video PCs.

—D. L. Andrews

BSDI: Unixlike and Free of AT&T

To a cheering audience of 1000 Usenix conference attendees, former SunSoft employee Rob Kolstad announced his new company, BSDI (Falls Church, VA), and its new product, a Berkeley Unix-compatible operating system for 386 and 486 PCs. The Unixlike software, called BSD/386, is 100 percent free of AT&T code and licenses, which means it costs less: Including the kernel and full source code, it sells for \$995. A binary-only (i.e., non-source code) version should be available in the third quarter of this year for \$500.

BSD/386 is a complete operating system that is compatible with BSD 4.3 with BSD 4.2 networking. It includes TCP/IP, X Window System 11.5, Posix functions,

ANSI C, C++, troff, Tex, and a reimplement of Sun's Network File System. It supports more than a dozen popular Super VGA cards, most mice, and SCSI, IDE, and ESDI controllers. To use it, you'll need a 386 or higher PC with 4 MB of RAM and a 100-MB hard drive. By the third quarter, BSD/386 will be able to run all SCO Unix applications without a hitch, BSDI says.

The product is the result of years of effort by the Unix community to create a widely available, AT&T-code-free Unix work-alike. The crowd responded to Kolstad's presentation with great enthusiasm, applauding and cheering each member of his team.

—Ben Smith

NANOBYTES

It wasn't quite the same as Dire Straits front man Mark Knopfler singing about moving refrigerators

and color TVs, but as BSDI program manager **Rob Kolstad** explained all the various licensing options of his company's Unixlike BSD/386 software, he said with his usual wit,

"I'm Crazy Rob. I've gotta move these kernels." □

At Buscon/92-West in Long Beach, California, IBM showed a technology demonstration of streaming data approaching a **160-MBps data transfer peak**. The demonstration used a modified RISC System/6000 deskside unit and a bus-master adapter card on the Micro Channel bus, both developed specifically for the demonstration. □

At UniForum, DEC announced version 1.0 of **DEC OSF/1**, what the company calls the "first production version" of the Open Software Foundation operating system. Users can't install this system, which is a developer's version, scheduled to ship last month. The end-user platform will be version 2.0, due in the second half of the year. □

At the recent National Association of Music Merchants International Music Market show, Passport Designs (Half Moon Bay, CA) announced a preliminary version of Producer, which the company calls "integrated digital audio and MIDI soundtrack software." The software, the first version of which will run on the Mac, will integrate computer animation, graphics, titling, laser discs, video, CD-ROM, MIDI, samplers, sound cards, and soundtrack software. The company also plans a Windows version. Passport says that the main use of Producer is as a media integration tool, accepting inputs from many sources and letting you build a final product. □

- ▶ **The Best Value in 32-Bit Tools: \$895***

Unleash 32-bit Power!

WATCOM C9.0/386 lets you exploit the two key 32-bit performance benefits. The 32-bit flat memory model simplifies memory management and lets applications address beyond the 640K limit. Powerful 32-bit instruction processing delivers a significant speed advantage: typically at least a 2x speedup.

You Get:

- ▶ **100% ANSI and SAA compatible:** C9.0/386 passes all Plum Hall Validation Suite tests
- ▶ **Extensive Microsoft compatibility** simplifies porting of 16-bit code
- ▶ **Royalty-free run-time** for 32-bit DOS, Windows and OS/2 apps
- ▶ **Comprehensive toolset** includes debugger, linker, profiler and more
- ▶ **DOS extender** support for Rational, Phar Lap and Ergo
- ▶ **Run-time compatible with WATCOM FORTRAN 77/386**

32-bit DOS support includes the DOS/4GW 32-bit DOS extender by Rational Systems with royalty-free runtime license

- ▶ Virtual Memory support up to 32Mb

32-bit Windows support enables development and debugging of true 32-bit GUI applications and DLLs.

- ▶ Includes licensed Microsoft SDK components

32-bit OS/2 2.0 support includes development for multiple target environments including OS/2 2.0, 32-bit DOS and 32-bit Windows

- ▶ Access to full OS/2 2.0 API including Presentation Manager
- ▶ Integrated with IBM Workframe/2 Environment

AutoCAD ADS and ADI Development: Everything you need to develop and debug ADS and ADI applications for AutoCAD Release 11

Novell's Network C for NLM's SDK includes C/386

The Industry's Choice.

Autodesk, Robert Wenig, Manager, AutoCAD for Windows:

"At Autodesk, we're using WATCOM C/386 in the development of strategic new products since it gives us a competitive edge through early access to new technologies. We also highly recommend WATCOM C/386 to third party AutoCAD add-on (ADS and ADI) developers."

Fox Software, David Fulton, President: "FoxPro 2.0 itself is written in WATCOM C, and takes advantage of its many superior features. Optimizing for either speed or compactness is not uncommon, but to accomplish both was quite remarkable."

GO, Robert Carr, Vice President of Software: "After looking at the 32-bit Intel 80x86 tools available in the industry, WATCOM C was the best choice. Key factors in our decision were performance, functionality, reliability and technical support."

IBM, John Soyryng, Director of OS/2 Software Developer Programs: "IBM and WATCOM are working together closely to integrate these compilers with the OS/2 2.0 Programmer's Workbench."

Lotus, David Reed, Chief Scientist and Vice President, Pen-Based Applications: "In new product development we're working with WATCOM C because of superior code optimization, responsive support, and timely delivery of technologies important to us like p-code and support for GO Corp's. PenPoint."

Novell, Nancy Woodward, V.P. and G.M., Development Products: "We searched the industry for the best 386 C compiler technology to incorporate with our developer toolkits. Our choice was WATCOM."

Spreadsheet Could Boost PenPoint

At-Hand, a spreadsheet developed for Go Corp.'s PenPoint operating system for pen-based computers, could be the first application to validate the PenPoint platform. Developed under the direction of Dan Bricklin, vice president of development for Slate (Scottsdale, AZ), the program fully exploits the advantages of pen computing.

Bricklin gave this reporter a preview of At-Hand running on a prototype pen-based machine from Samsung. Instead of using a traditional spreadsheet's edit line to enter labels and values, you just write directly into cells using the stylus. At-Hand offers a 256- by 8192-cell grid, immediate access to 90 built-in functions, and 15 types of charts and graphs. Bricklin described the language as "BASIC-like...but it knows about spreadsheet primitives such as cells and ranges."

At-Hand reads and writes WK1 (Lotus

1-2-3) and XLS (Excel) files. In a typical scenario, Bricklin says, users will transfer files to and from their pen and desktop systems. When At-Hand files are sent to the desktop, the program provides a choice of export formats. Of course, it supports PenPoint's standard gestures and connectivity and recognizes handwriting, with optional deferred recognition. It also incorporates an extensible graphics language that lets corporate developers improve the spreadsheet's graphing capability by creating specialized graph types.

The software uses 1.5 MB of hard disk space and requires only about 500 KB of RAM to run. Although it is scheduled to ship in the second quarter of this year at a list price of \$295, At-Hand product manager Lisa Underkoffler cautions that the schedule is dependent on Go's releasing PenPoint.

—D. L. Andrews

RFI Problems Plague Pen Systems

Massive increases in RFI from pen-based computers are causing the FCC to rethink its testing procedures; it has already delayed the release of at least one pen-based system. The RFI problem doesn't pose a health threat to users, but it does mean that some of the eagerly awaited pen-based designs will be later to market than expected because of redesigns.

The problem is that when you place your hand close to the screen of an operating pen-based computer, the RFI the computer produces increases enormously. Since all pen-based systems involve writing on the screen with a stylus, that increase occurs with normal use of the system.

Charles N. Cobbs, chief of the FCC's equipment and authorization branch

(Columbia, MD), says that the emissions increase can be as much as 15 dB. "This is not like tripping over a curb, it's like falling over a cliff," Cobbs says. "We couldn't let that go."

Essentially, the human body serves as an antenna to radiate additional energy from the computer. The radiation is not dangerous to people, but it is enough to interfere with electronic equipment.

The problem was unexpected because the FCC's current test standards don't allow for a user's effect on the system RFI. As a result, the manufacturers weren't looking for those effects in their designs. The first company to get caught with this problem was NCR and its 3125 pen system.

—Rick Cook

Apple and Sharp May Be Paired Up in the Consumer Market

Now that Apple chairman and CEO John Sculley has said that Apple will enter the consumer electronics market, observers have wondered what products the company will offer. Sculley told attendees at the semiannual Consumer Electronics Show that Apple will enter the "digital consumer information products sector of the consumer electronics industry" and reiterated Apple's interest in the technology of Personal Digital Assistants.

Sculley also said that Apple has worked this year to establish relationships with several leading consumer-electronics companies. Sony may be the company that comes to mind as first choice for a partnership, but sources say that Apple will work with Sharp on CD-based devices, which may already be built. Longtime Apple partner Frogdesign may also have had a hand in the devices' design.

—Larry Loeb

NANOBYTES

When you see this man's face, think of QuickTime. In his keynote address at the MacWorld Expo show,

Apple chairman and CEO **John Sculley** said that what people would remember the most about his time at Apple is QuickTime—even more than the Mac-

intosh. □

It's also now clear that Apple thinks QuickTime will influence platforms other than the Mac. At the show, Apple announced plans to bring the benefits of QuickTime to other computing environments such as DOS, Silicon Graphics, DEC, and Cray Research. To further extend the adoption of Apple's Movie file format, **Corel Systems** is developing a file format translator to be shipped with the QuickTime Starter Kit, a product for those who want to explore the capabilities of QuickTime. The Corel utility will allow the conversion of popular DOS and Windows format presentations, graphics, and animation files into QuickTime movies. Apple wants QuickTime to be the cross-platform method for personal computers to handle multimedia. □

At NetWorld, CE Software announced QuickMail for MHS (Message Handling Services), which the company says will provide Novell network users with "similar functionality and flexibility" to the QuickMail product for the Mac. Previous versions of QuickMail supported Macs and PCs, but they required both a Mac server and an AppleShare network. The planned new version will provide **native NetWare MHS** support for the Macintosh. □

Apple is reportedly working on new technology that lets people control off-the-shelf Macs using ordinary spoken language. The technology may be used in future consumer products. □

**NEC introduces
a 486 series
that has a
built-in survival
instinct.**

Next time you need a mission-critical PC or network server, here's something you might want to think about: NEC is one of a handful of companies that have received the Deming Award, the highest honor bestowed in the quality assurance field, on five separate occasions.

NEC's new PowerMate Express Series. A lesson in survival and security.

Imagine a line of affordable 486 PCs and towers that is completely modular and upgradable.

Now imagine how secure you'd feel in your decision to purchase such a system. A system that would not only meet your needs today, but also adapt to changing technologies.

We adapt to your environment.

With NEC's new PowerMate® Express™ Series, you get total sub-system modularity and scalability, including CPU, memory, video, disk subsystems, and EISA option slots at no extra cost. All working in balance with each other. And flexible enough for your particular needs.

An easy-open chassis design, featuring thumb screws and snap-in device rails, gives you convenient access to all internal subsystems. Standard SIMM sockets—16 of

them—provide for easy, inexpensive memory expansion.

You can add an MIS-preferred EISA SCSI host adaptor.

And choose from three video options—Base VGA, 1024 VGA, even BITBLT EVGA for graphics-intensive applications.

In short, you can configure your system exactly the way you want it.

128-bit memory path gives us quicker reflexes.

Instead of the traditional 32-bit memory path, our PCs have one that's four times as wide, guaranteeing you 0-wait state performance even at faster processor speeds. Giving you the ability to handle data-intensive applications or networking

demands with ease.

Our best feature hasn't been invented yet.

Perhaps the best feature of the PowerMate Express Series is its ability to reduce the possibility of your system becoming obsolete soon after you buy it.

Our CPU scalability starts at 486SX/20 for only \$2,999* and goes up through 486SX/25, 486/33, and beyond.

All at affordable prices.

What's more, our modular systems are ready for the next generation of Intel® microprocessors, and adaptable to new developments in video and memory technologies.

We can take the heat.

We've given each of our PCs generous power supplies to handle even the most power-hungry components. As well as a three- or four-fan array, to enable your system to keep cool—and keep working—under any amount of pressure.

Proof that a well-balanced system is a weapon.

Scalability. And balance. In the end, that's what distinguishes our

486 computers from others in their class.

Just look at a side-by-side comparison of our features versus COMPAQ's and AST's.

We think it's further proof that investing in a PowerMate Express Series PC or tower could very well be one of the best decisions you'll ever make.

A decision that will help you survive in today's business environment. And tomorrow's.

| Desktops: | NEC PowerMate Express Desktops | COMPAQ Deskpro/54 Series | AST Premium II Series | Advantage |
|---|--------------------------------|--------------------------|--------------------------|-----------|

Microsoft and Intel Team Up on Portable Power

Until computer hardware gets less energy-hungry, the only way to cut power use in portable machines will be through better software tricks. Microsoft and Intel have now created a suite of technologies, called the Portable Computing Initiative, that are intended to do just that. By matching operating-system features with the special hardware of portables, the two companies aim to improve the efficiency of mobile computing.

The Portable Computing Initiative encompasses several efforts, including putting system software in ROM instead of on disk, developing drivers for PCMCIA solid-state storage cards, and building a simple data transfer utility into DOS.

The most innovative development is called Advanced Power Management (APM), which gives applications the ability to tell the hardware when it doesn't need certain system resources, such as I/O ports; this will let programs help the system save energy. Most power management

today is performed only at the system level, without regard to program state.

According to Microsoft, Windows and many applications are idle 50 percent to 75 percent of the time, waiting for user input or other system events. By providing an application programming interface (API) through which compliant programs can write to the system BIOS and say that they are idle, you can cut power usage by as much as 25 percent, Microsoft says. Not only can the system be intelligently shut down, but it can also select peripherals or add-ins. The APM scheme is defined independently of the CPU, chip set, and operating system.

Why use an API instead of building these features directly into the operating system? Unlike in the Mac world, where virtually all software interacts with the system through defined system calls, many DOS programs bypass the operating system and interact directly with firmware.

—Owen Linderholm

Headland's Cache Enhancement Chip Set Optimizes the 486

Headland Technology (Fremont, CA) has introduced a chip set with cache-enhancement features that optimizes the performance of the 486 processor's internal cache. The company says that the benefit of the HTK340 chip set is that the processor never has to wait for write operations, resulting in improved system performance.

As Headland describes it, the significant performance determinate, on the system level, of the 486 is efficiency in memory write operations. Headland says its advanced features eliminate the write bottleneck by integrating a four-level-deep write buffer with out-of-order operations and byte gathering. The company tries to eliminate the DRAM write bottleneck by assembling 8- and 16-bit writes and writ-

ing them as 32-bit writes, and by allowing out-of-order operations while maintaining the integrity of the data.

Headland claims a twofold to fourfold improvement in DRAM write operation efficiency. Like the first member of this family, the HTK320 386DX chip set, the HTK340 is a two-chip set that includes an ISA bus controller chip and a memory controller unit. A Headland product line manager admitted that the improvement offered by the chip set isn't all that evident with low-level benchmarks. It shows up more on "complex, real-world" benchmarks.

The chip set supports frequencies of up to 33 MHz. It will cost \$45 each in quantities of 1000.

—Ken Sheldon

C&T Quits Multiprocessor Business

Chips & Technologies is pulling out of the multiprocessing chip-set business. Saying the market is too small, the company has announced that it will try to sell off its M/PAX architecture and technology, which can tie together as many as six 386 or 486 processors in a LAN server.

C&T was the only company left trying to make money as a merchant supplier of multiprocessing chip sets. Most multiprocessing servers, such as the Systempro from Compaq, use proprietary designs. ■

—Rick Cook

NANOBYTES

To reduce use of the power-hungry hard drive, Microsoft has developed a ROM-based version of DOS 5.0, and it's now shipping. The company also says it has created scalable versions of DOS 5.0 that take up less RAM in exchange for reduced functionality. One tiny 4-KB version of COMMAND.COM lets a system run DOS programs but not perform any other functions. This will be especially useful for palmtops with limited memory and that only need to launch programs. □

Slate vice president Dan Bricklin predicts that in two years some pen-based computers will retail for under

\$1000. The same systems today can cost as much as \$5000, if you can find one. Bricklin said that pen-based systems running Pen-

Point are currently "scarcer than hens' teeth." After a pause, he added, "Actually, there are a lot more hens' teeth in the world." □

Specular International (Amherst, MA) is working on a tool for reducing the time required for rendering graphics images. A new program called **BackBurner** lets you render a single image on multiple Macs by dispersing rendering tasks over Ethernet or AppleTalk networks and relegating the most intensive rendering duties to the fastest available machines. BackBurner must be used with Infini-D, Specular's 3-D rendering, modeling, and animation software. Pricing has not been determined. □

The great baseball player Satchel Paige once said, "Don't look back—something may be gaining on you." Intel must feel that way sometimes about AMD. AMD is developing a 486 and a 33-MHz version of the Am386SX, which will be manufactured with an advanced 0.7-micron CMOS process that allows low power operation. ■

The Borland *Visions* Video Series

Now the easiest way to learn software!

NEW!

Borland makes learning fun

Now there's a faster, easier and more entertaining way to gain proficiency in today's top software and advanced technology. In a

David Intersimone, Borland's language ambassador, makes learning software fun!

matter of hours, you can master all the concepts presented. You're taught exactly what you want to learn. And it's all self-paced, so you can learn when and where it's convenient for you.

Learn from the experts

Taught by internationally recognized experts, each videotape training course provides a thorough and fun way to learn, using easy-to-understand examples presented in clear, everyday language. Lively presentation is further

enhanced by state-of-the-art production techniques and exciting animation graphics. Easy-to-follow workbooks written by recognized authorities solidify the concepts. And, in many cases, free sample source code is included so you can get off to a fast start by simply plugging it into your application.

Ideal for everyone who uses a PC

Programmers, developers, MIS, department managers—nearly anyone who uses a PC can benefit from the Borland *Visions* Video Series. Every videotape is a complete, step-by-step tutorial.

So whether it's understanding what Object-Oriented Programming is all about or learning how to best manage corporate data, Borland has a video for you. Most of all, it's fun. Order today!

"Borland clearly invested a lot of care in this project, and the result is an excellent example of what a multimedia course can achieve when done right."

Craig Menefee
writing about *World of C++* in
Computer Shopper, Feb. 1992

Every video training package under \$100!

World of ObjectVision

Learn to create your own Windows applications *without programming*. With ObjectVision® it's easy, and this clear videotape with sample applications makes it even easier. Now everyone from non-programmers just getting started . . . to developers looking for faster application prototyping can create their own Windows applications in

no time. Hosted by John Mandell. Sample ObjectVision applications included. 85 minutes.

\$39⁹⁵

Free compiler included!

Learn Programming Today with Turbo Pascal

Did you ever wish you had the power to program your own computer and write your own programs? Easy videotape instructions, workbook and sample programs will teach you how to write programs in record time. Perfect for the beginning programmer. Hosted

by Zack Urlocker. Workbook written by Keith Weiskamp. 90 minutes.

\$69⁹⁵

World of Database Management

Now more than ever, information is power. Learn the latest concepts in database management software, including object-oriented technology and

Windows database technology. If you want to manage corporate information in the most efficient and profitable way, this videotape is a must-see. Hosted by Philippe Kahn. 29 minutes.

\$19⁹⁵

World of Objects

Philippe Kahn and his special guests take you on a guided tour of the basic concepts behind Object-Oriented Programming. A fact-filled overview full of fun and insight for everyone. 20 minutes.

\$19⁹⁵

Make the Move from C to C++!

The Award-winning World of C++

World of C++ is the easy way for the experienced C programmer to step up to C++ and the power of Object-Oriented Programming. With 21 lively video lessons, David Intersimone gives you a solid

understanding of how C++ works, and how you can use it to streamline your programs and speed through development cycles. Comes complete with videotape, workbook and sample source code. Workbook written by Bruce Eckel. 120 minutes.

"The combination [of video, workbook and source code] . . . is the best introduction I've ever seen to any complex language."

Jerry Pournell, *BYTE*, December 1991

only \$99⁹⁵

World of ObjectWindows for Turbo Pascal

The ObjectWindows™ application framework provides easy-to-add-on Windows user interfaces for Turbo Pascal®. This complete training package will show you how to get the most out of this cutting-edge technology in the shortest

\$99⁹⁵

amount of time. Hosted by David Intersimone.

Workbook written by Tom Swan. Sample source code included. 120 minutes.

World of ObjectWindows for C++

Now C++ programmers can skip the tedious chore of writing Windows user interfaces—with just a few lines of code you can add the robust ObjectWindows application framework to your application. Two videotapes, workbook and source code make it easy to get

up to speed fast in Windows. Hosted by David Intersimone. Workbook written by Tom Swan. 120 minutes.

Windows 3.1 Is Ready to Roll

JON UDELL

After a long gestation period, Windows 3.1 has matured into a solid product that fixes past problems and introduces mainstream PC users to multimedia

You'll notice longer lists of supported display adapters, printers, and networks. The standard display drivers now include Texas Instruments Graphics Architecture,

Scalable fonts, compound documents, and multimedia support are headline attractions, but the Windows 3.1 story doesn't end there. A great many fixes and refinements—none revolutionary—conspire to make version 3.1 a faster, friendlier, and stabler system. You'll notice improvements as soon as you launch Setup. Following an optional tutorial, you can take the "express" or "custom" route. Choose the latter, and you specify the games, wallpaper, and accessories you want and skip the rest. (The multimedia subsystem is not optional, however.)

Extended Graphics Array, 8514/A, and a generic Super VGA (800 by 600 pixels with 16 colors).

Something that most users won't see, but that I appreciate, is Setup's more intelligent handling of network installation. The new Setup /A option streamlines the process of loading a site-licensed copy of Windows onto a network drive and marking the files read-only. Tweak a few lines in a Setup file, and you can present users with shared Program Manager groups containing only the applications you want them to run, while crippling Program Manager's ability to launch unauthorized software or to create new groups and items.

Serious network administrators still have plenty of reasons to lean on advanced utilities like Windows Workstation from Automated Design Systems. But those who rightly complained about LAN installation of Windows 3.0 will find version 3.1 more cooperative.

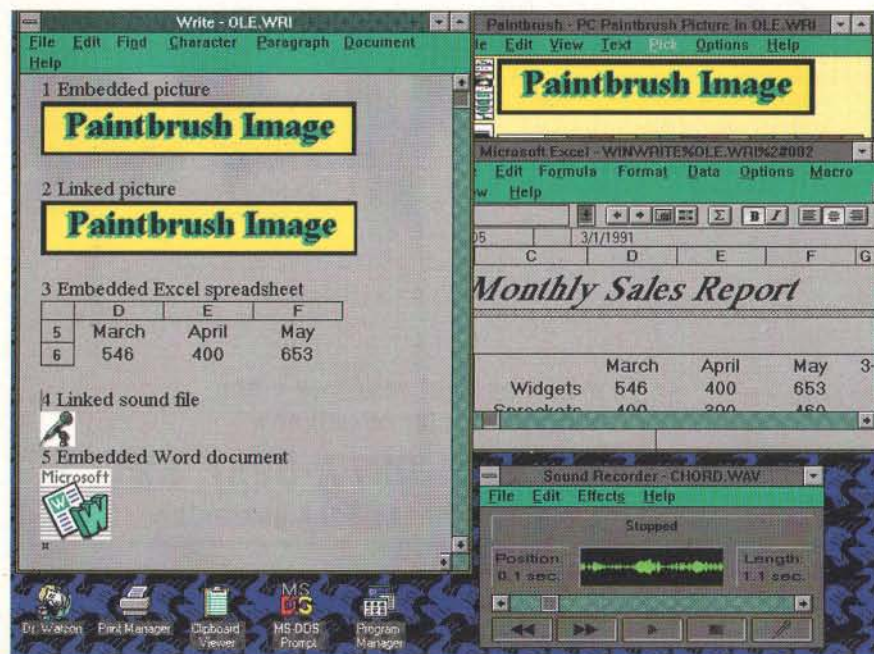

Printing with TrueType

TrueType isn't just an Adobe Type Manager clone. On your screen, the two technologies produce similar results—fonts that scale cleanly. But TrueType's superb printer support transcends what ATM offers. If you have a Hewlett-Packard LaserJet Series II and you don't have HP soft fonts, or don't have them installed properly, ATM can create pages that match what you see on-screen only by cranking out huge bit maps that clog your network and take forever to print. TrueType, on the other hand, conjures up the downloadable fonts on the fly. It's fast, convenient, and utterly transparent.

The same technique works with PostScript printers: TrueType can manufacture unhinted Adobe Type 1 fonts on the fly. If you inspect the PostScript code that's generated, you'll see that the driver cleverly defines only the characters actually used in the print job. You can also send bit maps, or, if you know that the printer has an Adobe font whose metrics match those of a TrueType font, you can just invoke the printer fonts directly.

Choose Your Mode

Windows 3.1 abandons the vestigial real mode. Users won't mourn its passing—version 3.0 would run on an 8086, but not happily—and programmers will breathe a collective sigh of relief. That leaves standard mode for 286 and low-end 386 machines and enhanced mode for 386/486

Objects embedded in or linked to a Write document launch their creators when you double-click on them. It looks easy, but you may be surprised at what happens when you save, copy, or print the document. OLE breaks important new ground but raises thorny user-interface issues.

It Talks, It Sings, It's Multimedia Windows

Tom Yager

Windows 3.1 seems like much more than a point release. But one crucial piece of it—multimedia support—hit the streets several months before its commercial release. The Windows Multimedia Extensions are part of the Multimedia PC specification (see "The Multimedia PC: High-Powered Sight and Sound on Your Desk," February BYTE). With version 3.1, the software side of MPC becomes a standard part of Windows.

What the extensions buy you depends largely on your configuration. The most accessible addition is audio. If you have an audio I/O card like Creative Labs' Sound Blaster Pro, the new routines and applications in version 3.1 will let you record and play digitized sound. If your audio card supports MIDI, or you have a component MIDI device that's compatible with Roland's MPU-401, version 3.1 will let you record and play MIDI data. The Multimedia Extensions are, not surprisingly, extensible, so in addition to audio and MIDI, they support the following media types: CD audio, videodisc, video overlay, and animation. Each of these types (except animation) requires additional hardware and, in most cases, drivers supplied by vendors.

In a way, animation requires additional hardware, too: a Mac, which is

now the only way to create an MPC-compatible animation. Support for full-motion (digital) video (using the "digitalvideo" media type) is expected shortly, and there are also reserved (but not supported) media types called dat, scanner, vcr, and other. I don't know what an "other" does, but the rest of the names are self-explanatory.

Some of the media types are covered by their own low-level programming calls. For some operations, such as MIDI recording, it helps to have the most direct control possible. But the heart of the multimedia programming support is the Media Control Interface. This is a well thought-out, high-level function-call interface to a command interpreter. An MCI command string includes a command, a target device, and arguments. The interpreter routes the command to the appropriate handler for the specified device.

The result is readable code and straightforward addition of new media types to existing applications. The string interface also works well with alternative Windows programming environments like ToolBook. Those of us who work in C need Microsoft's Multimedia Development Kit, which requires a CD-ROM drive and the Windows Software Development Kit.

MCI's command structure is pat-

terned after a tape transport. Commands supported by most devices include open, play, and pause. The first two are all that's required to get most media types to play or display their output. Here is one that plays a digital audio file called WILLIAM.WAV:

```
open \sounds\william.wav
type waveaudio alias bill
play bill
```

The alias simply gives you an easier way to reference the open file. Playing a MIDI file, an animation, a track on an audio CD, or any of the other supported media types is no more difficult than this, and digital video and other future types will follow the same command format.

If you're not a programmer, the fact that MCI is so easy to write helps you as well. MPC-compatible software will become available rapidly because MCI is such a cinch to learn and use. Microsoft probably hopes you'll see all the multimedia stuff in version 3.1 and run out and buy an MPC upgrade kit. Maybe that's not such a bad idea.

Tom Yager is a BYTE technical editor and director of the Multimedia Lab. He can be contacted on BIX as "tyager."

workstations with 2 MB or more. Version 3.1 will run in standard mode in the presence of DOS 5.0's EMM386 memory manager, something that version 3.0 refused to do. But users who have favored standard mode even on high-end hardware might want to reconsider that policy in light of version 3.1's enhanced mode.

The virtual memory manager has been overhauled, and disk I/O benefits from a new 32-bit virtual device driver that works with Western Digital and compatible hard drive controllers. A performance boost, not mode-dependent, comes from the new Smartdrive. Caching both reads and writes, it keeps my disk noticeably quieter than its version 3.0 counterpart.

Keep on Keeping On

As a DOS multitasker, version 3.0's reach often exceeded its grasp—it encouraged you to try things that either wouldn't work or wouldn't work reliably. This wasn't surprising, given the sandy DOS foundation on which Windows builds its airy superstructure of virtual machines (VMs).

What has pleasantly surprised me about version 3.1 is that, although the basic architecture hasn't really changed, DOS multitasking does work a whole lot better. Preliminary CPU and screen I/O benchmarks peg version 3.1 VMs well ahead of their version 3.0 counterparts. And the VMs are much more stable. Incidentally, version 3.1 can handle 9600-bps serial communi-

cations, even in the background.

Matching some of OS/2 2.0's features, windowed VMs now provide DOS mouse support and offer a variety of alternative fonts. An .INI file remembers the size and location of windowed DOS programs.

Windows now traps the three-fingered salute. Press Ctrl-Alt-Del, and version 3.1 prompts you to continue the current DOS (or Windows) task, kill it, or actually reboot. If you pull the plug on a DOS task in this situation, Windows shuts it down without the scary termination message.

According to Microsoft, Windows does a sanity check to see if DOS seems healthy. Even so, a rogue DOS task can subtly alter low memory and bring down the whole

system. Does that matter? In practice, it may not. I think many users just want Windows to run their important DOS programs "well enough," and version 3.1 meets that criterion better than version 3.0 did.

If a Windows task meets with misfortune—at your hands or in the form of what used to be called an unrecoverable applications error—you're in better shape than before. Windows again performs a sanity check, this time on its own data structures, and, according to Microsoft, it can even repair damage so the system can continue safely.

Additional lines of defense include stricter parameter checking (both at run time and in the Windows header file), more informative error messages when protection faults do occur, and a postmortem utility (Dr. Watson) that records Windows' state and the user's description of the actions leading to the fault.

Given that Windows and its tasks still share one local descriptor table in version 3.1, protected mode isn't as bulletproof as in Unix or OS/2. But the pragmatic approach that Microsoft has taken—managing faults both proactively and reactively—should help matters a lot.

On the Applications Front

Most Windows 3.0 applications I tried ran happily under version 3.1, including PageMaker, CorelDraw, Picture Publisher, Persuasion, Turbo Pascal for Windows, Word for Windows, and Excel. As you'd expect, I ran into some programs that will require maintenance upgrades, including PowerBuilder, Quest, and WinSleuth Professional. In general, however, your transition shouldn't be traumatic.

Old chestnuts like File Manager, Write, and Paintbrush improve in a variety of ways. For starters, they now exploit common dialog boxes for opening and saving files, selecting fonts, and printing. Mac programmers who have used `SFGetFile` and `SFPutFile` for years will find it amusing that Windows is only just now getting into the act. Still, better later than never.

File Manager now presents directory trees in a more useful double-pane format and reads in directories much faster. While it was formerly unusable on large network drives, it has become a handy tool for browsing and disk grooming. File Manager is also the source of version 3.1's new drag-and-drop behavior. You can drag files out of File Manager's window and drop

them onto Print Manager, onto iconized applications, or into open application windows. To print in this manner, the document you drop must be associated with an application that must define a print command in the new system registration database.

An even more interesting thing happens when you drop a .BMP file onto an open Write document. Windows thinks for a minute, and a Paintbrush icon appears in the file. When you double-click on it, Paintbrush launches and loads the bit map. You've just used drag-and-drop to embed a reference to one document inside another. Behind the scenes, Windows ran a tool called Packager to specify the embedded object's appearance (the Paintbrush icon) and its content (the reference to the .BMP file). Welcome to the weird, wonderful world of Object Linking and Embedding (OLE).

Everybody Say OLE

The version 3.1 accessories include OLE servers (Paintbrush and SoundEdit) and OLE clients (Write and CardFile). Other applications that formerly rolled their own OLE but can interoperate with the OLE libraries shipped with version 3.1 include Word, Excel, and Ami Pro.

The Write document in the screen contains a series of embedded and linked objects. The two Paintbrush images appear identical, but they aren't. The first, an embedded object, resides anonymously within the Write document. The second, a linked object, takes up the same amount of space in the Write document but refers to a named Paintbrush file. In both cases, double-clicking on the object launches Paintbrush. But the embedded object is accessible only via Write; the linked object can also be reached by loading its corresponding file into Paintbrush.

In addition to the drag-and-drop I've already described, you can embed an object by pulling a file directly into the client using the Insert Object command, or by copying from the server to the Clipboard and then using the client's Paste Special command. To link, you copy from the server to the Clipboard and use either Paste Special or Paste Link in the client.

This all sounds simple, and in a way it is, but it takes a surprisingly long time for all the implications to sink in. The three flavors of Paste command—Paste, Paste Special, and Paste Link—can be confusing, especially since Paste Special usually lists

a variety of formats the client can use to render the embedded or linked object. Yet the results of each of these procedures can look exactly the same.

Also, those results may or may not be what you expected. When you paste a range of cells from a spreadsheet into Write, you expect to see something that looks like a spreadsheet—and you do. When you double-click on the sound object, you expect to hear something, and with a sound board installed, you do. But when you paste a range of text from Word, what appears is Word's icon, not text. Why? The OLE client library can render only metafile or bit-map data. Microsoft has defined a way for an OLE server to provide an "object handler" that renders data on its own terms—formatted text, in the case of Word.

OLE in its current form is a bold experiment. It lacks the network awareness of Apple's Publish/Subscribe, begs for a next-generation file system that is itself somehow object-oriented, and often doesn't behave the way you'd expect, but it's a good start. As programmers learn how to use the daunting OLE libraries, I think we'll see Windows software evolve in fascinating new directions. ■

You don't have to replace circuit boards. You don't have to spend an arm and leg for upgrade modules. All you need is two fingers. One microchip.

And an AcerPower™

386SX or 486SX.

Because Acer

has invented something

no other computer in the world can give you. A

breakthrough technology that makes upgrading a

computer dramatically easier

than ever. For a lower cost than

ever. And it's available off-the-shelf

from dealers everywhere.

We call it ChipUp.™

Take the AcerPower 386SX. It comes out of the box as a 386SX machine. When you're ready to upgrade, just drop in a 486 chip. That's it. The computer does the rest—upgrading itself automatically. Giving you up to five times the power. It's like buying an entirely new, state of the art computer for the price of a single chip.

So why worry that the computer you bought today will be obsolete tomorrow, when it's such a snap to prevent it?

Punch in 1-800-SEE-ACER in the U.S. and Canada and find out how a computer can save you money. Now. And in the future.

*Now, upgrading a
computer is as simple
as plugging it in.*

Have Docking Station, Will Travel

RICH MALLOY

The NCR 3170 Safari Notebook, with its FingerPoint Mouse, signals a new generation of portables

introduced a bold new machine, the NCR 3170 Safari Notebook, which may set the pace for many notebooks to follow.

A Designer Notebook

Like the NSX/20, this new notebook is stylish enough to feel right at home in a designer showroom. But this system wasn't meant to sit around idly. It seems to have

Last year, Safari Systems, an interesting joint venture of AT&T and the Japanese company Marubeni, brought out the Safari NSX/20 notebook (see "IBM and AT&T Enter the Fray of 386SX Notebook Computers," August 1991). That system went on to win a BYTE Award of Merit and quite a bit of attention. This year, Safari Systems has been folded into AT&T's recent acquisition, NCR. The company has just

been purposely designed for three things: to travel, to run Windows, and to communicate. Based on the early prototype that I saw, I believe it will probably excel at all three.

For traveling, the system is small and light (only 5 pounds) and features the battery-friendly 386SL processor. (You can also save power by manually setting the speed to 6 or 12 MHz.) The size of the notebook is small enough (8 by 11 by 1 1/4 inches) to let you fit it into a briefcase with a ream of 8 1/2- by 11-inch paper.

To achieve the light weight, the floppy drive was put into a small external box, but it will be included in the price of the system. This arrangement lets you leave it home if you don't need it. To complement the 386SL processor, a power management system can automatically save power by cycling the system through four states: normal (25 MHz), slow (3.125 MHz), sleep (0 MHz), and suspend (the system shuts down and draws only 20 milliamperes).

Although there is no internal floppy drive, the new Safari system is one of the first to include a slot for PCMCIA cards. These cards are used mostly for adding memory or data storage, but there will soon be PCMCIA cards that function as network interface cards, 9600-bps modems, and even wireless modems.

For Windows, the system will feature 2 MB of memory (expandable to 20 MB) and a 17-millisecond 80-MB hard drive, which can hold at least a few Windows applications. A customized version of Windows 3.1 will be included with the machine, as will a power management-aware version of DOS 5.0a and an Asymetrix ToolBook TourGuide. The modifications to Windows will include such things as a large mouse pointer for easy use on a monochrome LCD screen. The 25-MHz 386SL processor with a 64-KB cache (and socket for a 387SL) ensures that the system will be powerful enough to handle almost all Windows tasks easily.

The display is a 9 1/2-inch sidelit triple-supertwist VGA LCD using cold-cathode fluorescent tubes. The contrast is excellent, even in direct sunlight.

For communications, the NCR 3170 includes a 2400-bps modem with MNP level 5 and V.42bis error correction and compression, and 9600-bps send/receive fax capability. Other ports are standard-size connectors for one serial and one parallel device (with enhanced data-transmission

Photo 1: The NCR 3170 Safari Notebook is similar in style to the award-winning Safari NSX/20 notebook.

capabilities), a mouse or keyboard, and a VGA monitor. On the software side, the system includes a Windows software package that allows background connection with AT&T Mail and BitFax software.

The FingerPoint Mouse

Perhaps the most unusual feature of the NCR 3170 Safari Notebook is its pointing device, the FingerPoint Mouse, which sits in the lower right corner of the keyboard, where the cursor keys are usually located. In fact, the FingerPoint Mouse replaces the cursor keys, with good results.

The FingerPoint Mouse consists of three keys that are aligned horizontally. The center key is round and about the size of a penny, and it can tilt in any direction. Tilting it in any direction moves the mouse in the same direction. The two keys to either side function like the two mouse keys on a Microsoft Mouse.

What about the cursor keys? As it happens, the FingerPoint Mouse can control either the mouse pointer or the cursor. You merely press two keys simultaneously to toggle between the two functions.

How well does the FingerPoint Mouse work? There are two answers to that question. When it is used to control the cursor, the function is fairly straightforward. In fact, in some cases it is better—and definitely more intuitive—than a set of cursor keys. But in mouse mode, the answer involves some personal taste, which is usually the case when mice are involved. Based on an early prototype that I used, I found the FingerPoint Mouse good for small precise movements, such as moving columns of text in a desktop publishing program.

Opinions on the FingerPoint Mouse will vary. However, dedicated mouse users will appreciate the PS/2-style mouse port on the side of the system.

A Portable Docking Station

A docking station—a desktop device that attaches to a notebook and provides additional capabilities—is nothing new. But for its docking station, Safari has provided a novel twist: portability. This docking station is so small that even when it is mated with the notebook, the entire unit can still fit inside some briefcases.

This small size belies the capabilities inside: three bays for peripherals (e.g., a floppy drive) and two expansion-card slots (one full-length AT slot and one half-length XT slot). Depending on how many

Photo 2: The docking station is almost as portable as the notebook itself. It weighs only 9 pounds with its batteries.

expansion cards are inserted, there is even space inside for two nickel-cadmium batteries of the same type that is used by the notebook. The total size of the unit, including notebook and docking station, is only 12 by 15 by 3 inches. The weight, loaded with peripherals and two batteries (plus one in the notebook), is 14 pounds.

Safari envisions the docking station being outfitted with a CD-ROM drive and an RF modem. In fact, an RF modem based on the ARDIS network should be available around the same time the docking station is—near the end of this month.

Multiple Communications Options

Perhaps the most useful feature of the new Safari system is its wide array of communications capabilities and options. Safari designers have obviously not been shy about exploiting the communications expertise of two of its parent companies, AT&T and NCR.

As mentioned above, the NCR 3170 comes standard with a fax/data modem (either 2400 or 9600 bps) and Windows software for accessing fax messages and AT&T Mail. Currently, there is an interesting gateway in AT&T Mail that allows you to send short messages to Telefind alphanumeric pagers. New wireless modems, such as the ones mentioned for the docking station and the PCMCIA slot, should allow two-way wireless communication fairly soon.

Two-way wireless communication is where the NCR connection should come in handy, with its ARDIS cellular network. When these modems become available, Safari owners will be able to purchase

modems for either the ARDIS network or the more common voice-based cellular network.

Extras

There is a maximum contrast mode for easier viewing of text. In this mode, all text-mode colors are mapped to either black or white, without any intermediary shades of gray.

There is a CPU speed lock, which lets you bypass the power management facilities and lock in a desired CPU speed for performance-sensitive functions.

Finally, the small LCD window displaying various system-status icons can be seen if the system is open or closed. In addition, a mail icon in this display flashes when the serial port is in use and can be programmed to stay on when a mail message has been received.

Prices for the new notebook were unavailable at press time, but the price of a low-end version with an 80-MB hard drive should be around \$4700.

All in all, the NCR 3170 Safari Notebook combines a considerable amount of power, usability, and impressive design in a very small package. Shoehorning Windows into a system that can be easily carried and used in a variety of different locations is no easy task. The BYTE Lab should soon follow up with a review of a shipping version of this system. But until then, this is a system that deserves a good deal of attention. ■

C++ PLUS.

ONLY ZORTECH™ C++ OFFERS A TRUE MULTI-PLATFORM COMPILER AND MUCH MORE.

When it comes to building larger, more complex applications, C++ is the language of choice. And now with Zortech C++, Symantec presents the only C++ compiler that provides professional tools for Windows,™ DOS and OS/2 in a single, integrated package.

Zortech C++ goes well beyond the other C++ and C compilers by delivering more of the tools serious programmers demand—plus a collection of exclusive features designed to increase your productivity and reduce your development time.

All of which means you'll get your applications to market faster than ever before.

For starters, our unique WINC library automatically converts DOS command line programs to true Windows applications. And you won't need to switch development systems, because you'll have the flexibility of moving to different platforms.

Zortech C++ even includes royalty-free 32-bit and 16-bit DOS extenders, for the cost-effective development of programs with advanced memory requirements.

And since Zortech C++ provides absolutely everything you need

Zortech C++ dramatically cuts your multi-platform development time by supporting the complete range of PC architectures.

to edit, compile, link and debug any Windows application, you won't need to buy the Microsoft Windows SDK. We've also added a help compiler and engine, a resource compiler, Windows header files and libraries, and printed SDK documentation.

For unmatched performance, Zortech C++ offers globally optimizing compilers that boost program speed and significantly reduce program size. So regardless of the platform, Zortech C++ delivers performance and security where it matters...in your finished application.

In fact, as the safest choice you can make, Zortech C++ ensures total C++ and ANSI C compatibility. It's also supported by leading third-party utilities, libraries and other tools. That's probably why more and more corporations are moving to Zortech C++ for their application development.

UPGRADE TO ZORTECH C++ FOR JUST \$199.

There's never been a better time to take advantage of the world's first multiple-platform C++ compiler.

Because, for just \$199, users of Borland C++ and Microsoft C can now upgrade to Zortech C++ For Windows, DOS & OS/2—that's a savings of \$500!*

And if your applications require even greater numerics support, pick up the Zortech C++ Science and Engineering Edition (which offers everything from the Windows, DOS and OS/2 version, along with the M++ array language extension, IEEE-754 and NCEG 91-015 numerical support, and much more).

Zortech's industrial-strength compiler breaks through the DOS 640K barrier, enabling you to develop programs of up to 16MB and beyond.

Either way, you'll get unmatched Zortech quality backed by Symantec's outstanding service and support. So visit your dealer or call us at **1-800-228-4122, Ext. 804Y** for more information about Zortech C++ and our competitive upgrade offer.

The security of one compiler across multiple platforms has never been more essential. With Zortech C++, developing applications has never been easier or more efficient.

SYMANTEC.

New from Compaq: Deskpro 50M

Of the many changes that have occurred at Compaq recently, the most notable are several new products: a 486DX2 processor module, a 1024- by 768-pixel resolution graphics accelerator board, and a 17-inch flat-tension-mask color monitor. Combined, these products form a most impressive graphics workstation, which Compaq calls the **Deskpro 50M**.

The Deskpro 50M has 8 MB of RAM (expandable to 64 MB). You have a choice of a 19-millisecond 120-MB hard drive, a 12-ms 340-MB hard drive, or no hard drive at all. Like the other members of the Deskpro/M family, this machine has a rather standard desktop size (17 by 15 by 6 inches). However, it also features five EISA slots (one used by video), a fairly husky (240-watt) power supply, and a removable I/O board containing ROM chips and the system's CMOS battery.

486DX2 Module

The processor module in the Deskpro 50M is built around the newly announced Intel 486DX2 chip. This chip runs at 50 MHz internally, but it has a special interface that lets it appear to the external world as a 25-MHz chip, which lets designers more easily build systems around it. However, this 25-MHz operation also causes the chip to perform at slightly slower rates than you might expect based on its internal 50-MHz clock. Intel claims that instead of running at twice the speed of a 486DX/25, the DX2 will run merely 50 percent to 70 percent faster, depending on how the memory is organized.

To squeeze as much performance as possible from the new chip, Compaq has augmented the 8-KB internal cache on the 486 with a 256-KB two-way associative write-back cache. Preliminary performance numbers based on BYTE Lab benchmarks and an early prototype of the system suggest this could be one of the fastest DX2 systems on the market.

Compaq has wisely implemented the DX2 on a processor module that can be used as an upgrade processor for owners of other Deskpro/M systems or System-

pro/LT file servers. Probably, though, the DX2 processor will be purchased most often as part of the Deskpro 50M.

New Graphics Controller

No matter how fast your processor is, you can get even better graphics performance with a graphics accelerator card. Thus, the Deskpro 50M comes with Compaq's new **QVision 1024/E Graphics Controller**. This EISA card features 1 MB of video RAM, which lets it support 256 colors in 1024- by 768-pixel resolution and 65,000 colors in 640- by 480-pixel resolution, as well as regular VGA.

For enhanced Windows performance, the card features a BitBlt engine and a hardware cursor. For fast AutoCAD performance, the card has a line-draw engine. The net effect of these features is very impressive performance. (An ISA version of the card has slightly slower performance.)

THE FACTS

Deskpro 50M

Model 1: 8 MB of RAM and a 3½-inch floppy drive. Model 120: 19-ms 120-MB hard drive. Model 340: 12-ms 340-MB hard drive.

QVision 1024/E Graphics Controller

1 MB of video RAM, 1024 by 768 pixels with 256 colors, VGA compatible, and an EISA bus interface.

QVision 170 Color Monitor

17-inch diagonal, flat-screen, multi-scan color analog monitor, 1024 by 768 pixels.

Prices unavailable at press time.

Compaq Computer Corp.
20555 State Hwy.
Houston, TX 77070
(800) 231-0900
(713) 370-0670

Circle 1234 on Inquiry Card.

Flat-Screen Monitors

The latest rage in color monitors seems to be flat screens, and Compaq has decided to offer the flattest screens around. The company's new **QVision Color Monitors** are actually large-screen versions of Zenith Electronics' much-admired flat-tension-mask monitors.

Zenith Electronics (not to be confused with the computer manufacturer Zenith Data Systems) has been selling a 13-inch version of the monitor for years, but Compaq is the first company to offer 15- and 17-inch versions. The 17-inch screen that I saw was unique among large monitors, with a screen so flat that it seemed concave.

A New Tradition

At press time, all Compaq would say was that it would watch the market carefully and offer prices competitive with companies such as Dell and ALR, a promise it has made before and followed through on. If this new tradition holds, Compaq will soon be selling one of the most powerful and most cost-effective graphics workstations on the market.

—Rich Malloy

New Hard Drives Keep Your Data Safe

It's no secret that hard drives are the Achilles' heel of personal computer systems. Unlike the rest of a computer, which moves electrons from place to place, hard drives are electromechanical devices with lots of moving parts that sooner or later wear out—usually at the most inconvenient time.

That hard drives fail is a fact of life. What's an individual user to do? There are alternatives, and two new drives are cases in point. The Kalok KL3100 and the Quantum Passport XL take very different approaches to keeping your data safe, but both do the job admirably.

Kalok

Kalok isn't the most familiar name to end users. The company has concentrated on selling its line of hard drives to system makers and dealers. But Kalok is a name you should know about.

Kalok drives are plain-looking (OK, ugly) black boxes that have a disconcerting feature of making a great deal of noise when they access and write data. But don't be fooled.

In one of my prior incarnations as a PC consultant, I computerized a small business with a half-dozen computer systems. In one of them I installed a Kalok drive. I shook my head as I heard it clunk and clank through its paces. Four years later, all the other hard drives I installed have failed. The Kalok, however, just keeps clunking along.

The major reason that Kalok drives are so reliable (and make more noise) is that they use 50 percent fewer components than typical drives from major players. Fewer parts mean fewer pieces to wear out and break down. It works.

The KL3100 is Kalok's latest, a 3½-inch 105-MB IDE drive. It has a 32-KB on-board buffer with a proprietary look-ahead caching algorithm. Couple the cache with a configuration that uses 35 sectors per track, and the result is that the KL3100 delivers more data per rotation than its competitors. I measured its throughput at about 1.8 MBps, the type of speed more commonly seen from synchronous SCSI drives. (The average seek time is 19.5 milliseconds.)

Although Kalok won't provide a suggested retail price, you should be able to buy a KL3100 for around \$400. Its rated

mean time between failures is an impressive 50,000 hours (over five years), about twice the MTBF for competing drives. My experience shows that figure to be conservative.

Quantum

Last year's acquisition of Plus Development by Quantum was one of those proverbial marriages made in computer heaven. Both companies are known for making high-reliability (albeit expensive) drives. The newest fruit of the merger is a unique system indeed: the Passport XL. This is a series of four removable hard drives (ranging from 50 to 240 MB) that sets new standards for performance and reliability.

Each Passport XL unit is a completely self-contained and sealed SCSI drive in a shockproof container. There are external chassis for PCs and Macs, and an internal chassis fits in a standard half-height 5¼-inch PC drive bay. (You'll also need a SCSI board for your PC.)

The interface to the chassis is a pin connector at the rear of each drive unit. But you don't just push the drive in the chassis. As soon as you start to insert the drive unit, a motor-driven mechanism grabs it and gently pulls it into the chassis. This makes for high reliability. Quantum rates the drives for an incredible 20,000 insertion/removal cycles. That's the equivalent of inserting and removing the drive five times a day for 10 years.

The drives contained in each cartridge

are also unique. They have a built-in cache for an effective access time of 9 ms, and they have a sustained data transfer rate of 1.4 MBps. But it's their rated reliability that really raised my eyebrows. Quantum says that the MTBF is 250,000 hours. (That's 28 years!) It's even more impressive when you consider that these drives are designed to be removed, transported, and bounced around. Because of the rated life, Quantum is guaranteeing forward compatibility for the Passport XL. The company says you'll be able to use both the drives and the chassis as

new generations of products are introduced.

At first blush, the Passport XL seems expensive: A 105-MB drive unit, internal chassis, and SCSI adapter list for \$1207. But since it's designed to be a lifetime investment, it's an unbeatable value.

Both the Kalok and Quantum drives are indicative of a refreshing trend toward drives that truly keep your data safe. But a word to the wise: You still need to make backups. Murphy lives.

—Stan Miastkowski

New Video Options For Your PC

The 15-Inch Crystal Scan 1572FS

The new 15-inch Crystal Scan 1572FS has a flat, square, non-glare screen to reduce distortion around the corners and provide an edge-to-edge display area. We've also moved the fine tuning controls to the front of the monitor for easy access. The Crystal Scan 1572FS is an option with 386DX and 486 systems for an additional \$195. Availability is limited.

The new 15-inch Crystal Scan is bigger and better than the 1024 series.

The ATI™ Graphics Accelerator

You're really cookin' when you run a Gateway 2000 system with ATI's graphics accelerator, the Graphics Ultra. ATI achieves a quantum leap in performance by using a highly optimized graphics coprocessor on the Graphics Ultra card. The 1024 x 768 mode is fully compatible with IBM® 8514/A, VGA, Super VGA and previous IBM graphics standards, which makes it easy to install applications using the standard video drivers.

The ATI Graphics Ultra video card is standard with the 486DX/33 system, optional with other DX systems. The street price of this card is over \$500, but with the purchase of a Gateway 2000 system, you can upgrade to it for \$150!

Figures computed on a 486DX/33 and provided by ATI Technologies Inc.

Peripherals are sold only with the purchase of a system. If you already own a Gate

g A New 486DX2 Special!

386DX Systems

The 386DX systems have a true 32-bit memory bus and more expansion capability. We start with a genuine Intel® 80386 microprocessor on a Micronics® motherboard. We add a generous portion of RAM – 4MB expandable to a system total of 64MB. Put in 64K of cache RAM on the 386DX/33 for a nice performance boost. Add IDE hard drives from Western Digital. Then give them Diamond Speedstar Plus™ 16-bit VGA graphics cards with 1MB RAM, non-interlaced 14-inch Crystal Scan 1024 x 768 color monitors, Phoenix™ BIOS, a Weitek socket on the 33 and 200 watt power supplies. That's the basic recipe for these tried-and-true, workhorse computers.

Both systems have a 32-bit slot open in the standard configuration for RAM expansion. The motherboard has a total of one 32-bit and seven 16-bit slots, with one 32-bit and five 16-bit expansion slots available in the advertised configuration. Gateway's 386DX and 486 systems come in a desktop model that is roomy and easily accessible.

A floor-standing tower model is an option for an additional \$100.

486DX And DX2 Systems

Gateway 2000's 486 systems run on the real McCoy – an Intel486™ processor with built-in math coprocessor and 8K instruction cache. The ISA systems have a Micronics® motherboard, while the motherboard for the EISA systems is custom-manufactured for Gateway 2000. RAM is expandable to a system total of 64MB.

New on the ISA models is the ATI® Graphics Ultra, which is the fastest video card by far in its class. The EISA models include a Diamond Speedstar Plus, which is also a high-performance video card. Both systems come with 1MB video RAM.

The ISA systems have eight 16-bit slots on the motherboard, six available in the standard configuration. The EISA machines have eight 32-bit EISA slots on the system board. You

have five 32-bit EISA slots open in our standard configuration.

The ISA systems have Phoenix BIOS, while the EISA computers use Award® BIOS. All systems come with Weitek sockets and 200 watt power supplies.

INCLUDED WITH EVERY SYSTEM:

- One-year limited warranty • 30-day money-back guarantee
- Lifetime toll-free technical support • Free on-site service to most locations • Free bulletin board technical support
- C.O.D. terms and major credit cards honored • Net 30-day credit terms and leasing options available to qualified commercial customers

The VideoPhone Goes Home Computer

The company that provided the compression algorithm and the hardware for the AT&T VideoPhone 2500—Compression Labs—has announced a computer-based version of the same system. The **Cameo Personal Video System, Model 2001** consists of a small video camera that sits atop your Mac. The camera is connected to a *video processor module* that sits beside the system, sidecar-style. The camera passes the image to the video processor and then to an ISDN card in the computer, which transmits it over ISDN lines to another Cameo unit.

When your system receives a video image, the video processor passes it to a digitizing video card, which displays it on the monitor.

Unfortunately, those images still suffer from the need to cram lots of video information through a narrow communications bandwidth. At 15 frames per second—about half of what's needed for smooth motion—and a resolution about that of a VHS movie, this is a far cry from the viewscreens on the starship *Enterprise*. (If you don't want a caller to see you, you can close the shutter over the camera.)

The software that comes with the Cameo system is easy to use, mimicking a full-featured telephone. With a click of a mouse button, you can dial, activate the video image, see your own image, mute the audio, hang up, put your party on hold, or take a snapshot of a party's image. A graphical phone directory lets you store those snapshots, so you can later call some-

one just by clicking on his or her image. Slider bars let you adjust the image brightness and tint, as well as the audio volume (which comes through your regular telephone).

While it's less expensive than previous commercial videophones, the Cameo system isn't cheap. You'll need a Mac IIci, IIfx, or Quadra with System 7.0, QuickTime, a RasterOps digitizing display card, an Apple ISDN card, and access to ISDN lines. If you already have the Mac and the ISDN lines, the extra pieces will cost you about \$2000, not including the Cameo system itself, which costs \$2095. (The Cameo cost is \$1595 if you use your own video camera, which you can plug into the standard NTSC interface on the video processor.)

Given those constraints, Compression Labs is wisely aiming the Cameo system at businesses that are looking for a lower-cost alternative to the expensive telecon-

ferencing systems they've been using. Many of those customers already have the ISDN lines installed.

For the rest of us, however, Compression Labs has plans to branch out very soon. The company says it will have an IBM PC-compatible Cameo system later this year (the video processor itself is platform independent), as well as versions that will operate over normal (i.e., analog) telephone lines (which will make them compatible with the AT&T VideoPhone). Other proposed features include a "chalkboard" that will let you transmit freehand drawings as

you talk about them. Those kinds of additions could move the videophone from the realm of technological curiosity to standard consumer device.

—Kenneth M. Sheldon

Blue Dolphin Makes a Splash

The PC price/performance race shows no signs of slowing down, and it's certainly one area where end users are benefiting. The latest conspicuous example is the **486DX-50 Cache** from the interestingly named Blue Dolphin Computers. This is one loaded, powerful, and incredibly fast system at a price that will raise some eyebrows. At \$3749 complete, it is (as this was written) the most inexpensive 50-MHz system on the market.

As its name implies, the 486DX-50 Cache is built around Intel's 50-MHz 486

chip, which is finally becoming available in quantity. Besides the 486's internal 8-KB cache, the system includes a 64-KB external static RAM cache. As you'd expect, this is a screamer of a system. My preliminary BYTE Lab benchmark results showed this to be one of the fastest systems we've ever tested.

Running processor- and graphics-intensive applications at this speed is a revelation. It's especially noticeable with a GUI like Windows. There's virtually no delay in applications. One of my personal fa-

vorites for subjective performance measurement is AutoDesk's Chaos, which makes heavy use of the 486's built-in math coprocessor. Drawing a standard Mandelbrot set on the 486DX-50 Cache takes just a few seconds. (It can take minutes on slow 386 systems.)

It takes more than a fast processor to make a fast computer, and the 486DX-50 Cache is a well-integrated system. It comes standard with a Diamond Stealth video RAM graphics card with 1 MB of memory. One of the fastest VGA cards

available, the Diamond Stealth includes a number of software drivers, including Windows at up to 1024- by 768-pixel resolution.

The 486DX-50 Cache comes with an Optiquest-2000, a 15-inch flat-screen monitor that handles high-resolution non-interlaced Windows at a display size that makes it eminently usable. The Optiquest-2000 is a high-quality monitor at a fair price, making it a perfect match for the 486DX-50 Cache.

Other standard features include a 212-MB hard drive (either Seagate or Maxtor), a 5¼-inch 1.2-MB floppy drive, and a 3½-inch 2.88-MB floppy drive (soon to be a standard for small floppy drives). There's also 8 MB of RAM (expandable to 64 MB on the motherboard) and the usual complement of ports. Rounding things out are a Key Tronic keyboard and a Logitech mouse. DOS 5.0 and Windows 3.0 are preloaded on the system.

At BYTE, we see many "me-too" clone

THE FACTS

systems. Too many are hastily put together from substandard parts and pieces, and the companies often go out of business within months. Blue Dolphin is a refreshing exception to this trend. It's been in business for over six years.

Obviously, the Blue Dolphin 486DX-50 Cache system is also put together from standard parts and pieces. However, the company has done an enviable job of integrating high-performance and mid-priced components into an impressive system. No, it's not a big-name system from a big-name company. Some corners did have to be cut. But Blue Dolphin backs up its products with a 45-day money-back guarantee, a 45-day system replacement policy, a one-year warranty, and lifetime toll-free technical support. If you need (or want) cutting-edge PC performance at an affordable price, the 486DX-50 Cache is the system for you.

—Stan Miastkowski

Boxer: A Text Editor with Punch

One of the easiest ways to launch an argument among programmers is to emphatically state that one text editor is better than another. The **Boxer Text Editing System 3.20** from Boxer Software is a quick, powerful shareware product that deserves to receive some strong support of its own. The text editor's smoothly integrated mouse support is pleasingly comfortable and intuitive.

If you edit text files for a living, you won't find much lacking in Boxer. Although it is restricted to in-memory editing, this should be no problem for many of the programmers for whom Boxer is designed. I was able to load a 163-KB file in a 549-KB DOS session. The memory limitation

appears serious only when you attempt to edit multiple files simultaneously.

This editor has more features than I have space to describe, yet I did not experience

feature overload. Each function is but a single menu or keystroke away.

Some of my favorite functions include 26 single-key macros, the ability to write all files with a single command, removing extra blanks from the end of lines, and the addition of configurable headers and footers on printouts. The ability to search and replace text across all open files is a real time-saver. You can perform searches using text only or full regular expression matching, including checks for end of line, start of line, and match only complete tokens.

Boxer provides support for special VGA video modes. In addition to the common 43- and 50-line modes, Boxer provides a

THE SCREAMING SPEED YOU NEED

Windows Accelerators, from \$499*

Where we're going, there are no speed limits. ATI® Graphics Accelerators boost graphical applications like Windows® to escape velocity — and beyond.

PC Magazine picked our 8514•ULTRA® as their Editors' Choice among high-end graphics cards, calling it "...the fastest Windows performer." Now our new Graphics Vantage® takes its place alongside the 8514•ULTRA and the Graphics ULTRA®, as the most economical way of accelerating your PC beyond earthbound speeds.

Powered by the same Mach 8® graphics engine as the ULTRA products, the Graphics Vantage delivers resolutions from VGA® upward, and propels 800x600 and 1024x768 modes — in 256 dazzling colors — to over eleven times the

speed of Super-VGA adapters. It's like transforming your 386 into a rocket-powered 486 — instantly.

Our CRYSTAL Fonts® and flicker-free refresh rates — up to 72 Hz — clarify Windows with "near laser quality" text, readable down to 5 points even on 14" monitors. We've also equipped the Graphics Vantage with a Microsoft®-compatible mouse — and a down-to-earth price that will definitely give you no cause to scream — except perhaps with amazement.

ATI Graphics Accelerators. Because in today's world, there's no such thing as "fast enough."

GRAPHICS ULTRA

One of the ATI Graphics Accelerators™

GRAPHICS VANTAGE

28-line mode, which is useful because the edit area is a standard 24-line screen size.

In addition to standard editor features, Boxer provides a programmer's calculator (hexadecimal, octal, binary, and decimal); the ability to add columns of numbers; an ASCII chart; a movable ruler that measures in inches, millimeters, and picas; a calendar; and a function to remove tabs from text. Because this is a programmer's editor, Boxer provides the ability to compile files and then track through any generated errors.

Both keyboard commands and printer configurations are supported through customizable option files. Command configurations are provided for popular editors (e.g., Brief, Epsilon, WordPerfect, and WordStar). Printer support files include Epson, LaserJet, and Okidata 92. You can easily configure both the keyboard command and the printer configuration files so that you can use them with packages that currently are unsupported.

Boxer does have several interface quirks that I found annoying. The first is the distinction between windows and files. Most multiple-file text editors that I've used open each file in a separate window. Boxer does not do this. Although it supports multiple windows, Boxer also lets you cycle through each file in a single window. Such a separation of files from windows can be quite disconcerting until you become used to working with a text editor that is set up this way.

Another quirk is the implementation of what is called the End-End-End behavior. Brief exhibits this behavior. Pressing the End key once moves to the end of line. Pressing twice moves to the end of screen. Pressing three times moves to the end of document. The Brief keyboard mapping that is provided almost gives this functionality. Boxer, instead of counting End (or Home) presses, checks its position before moving. Thus, pressing End when at the end of a line moves to the end of

screen. This subtle difference in behavior is sufficient to cause no end of headaches.

Conclusion? Boxer is well worth a look. The beta version 3.20 I examined was reliable and responsive. Even though I have my own favorite text editor, I'm always looking for a freeware or shareware editor I can carry around with me when consulting on other people's systems. Boxer is a definite addition to my travel kit.

A Touch of CASE from the Gold Coast

PGC CASE Graphics 1.0 from Pacific Gold Coast is an interesting development and design tool that's in need of improvement. This \$129 package is not so much a full-fledged CASE tool as it is a diagram-drawing tool. PGC promises additional functionality (e.g., a data dictionary and diagram checking) in six planned modules. However, even a diagram-drawing tool can give the uninitiated a taste of the technology.

PGC CASE Graphics supports several standard diagramming methods: Yourdon data flow, Gane and Sarson data flow, Chen entity-relationship diagram, structure diagram, and structure chart. A special General Graph is provided, which seems to be a catchall for a collection of miscellaneous icons. The documentation claims that you can produce object-oriented programming software designs, but this appears to be limited to the ability to place circles and lines on a drawing.

The working diagram area is limited to the approximate size of a standard VGA screen and cannot be expanded. Because scrolling is not supported in the chart area, your final diagram is also limited to this size.

Diagram icons are presented in an easy-to-use tool bar. However, the tool-bar icons

themselves (e.g., an X for delete and a camera for copy) are nonintuitive. The complete lack of on-line help definitely hinders the learning process.

One of the package's most useful features is the ability to link multiple diagrams into a hierarchical network. Instead of linking actual icons to the next diagramming level, PGC CASE Graphics links labels. Although this is a little strange in concept, it works quite well because all icons typically have labels with which they are associated.

PGC CASE Graphics does an excellent job of moving icons and connected lines about the diagram quickly and cleanly, providing real-time rubber-banding (i.e., the ability to update and reposition the connecting lines to an icon as the icon is moved). Unfortunately, the text associated with the moved lines does not change position. Thus, after moving a portion of a rather complex diagram, I was forced to move all the labels individually—a task prone to errors.

In spite of the inadequacies I found in PGC CASE Graphics, I was able to create some decent-looking data-flow diagrams and structure charts, an exercise that brought to light some features I want to see in the next release. The ability to resize

icons is important, as is the ability to associate labels with lines. The additional capability to group and ungroup icons for copying and moving would also speed diagram development.

For the most part, PGC is on the right track with PGC CASE Graphics. However, I'd wait out the shakedown cruise and look for version 2.0. ■

The Quality Memory Solution

Phar Lap DOS-Extenders

When your reputation's at stake...

We know how much work you put into building your product. Why use inferior tools that often create more problems than they solve? With a Phar Lap DOS-Extender, you know you're getting industry-leading, market-tested tools that have worked reliably for thousands of developers. Other DOS extenders simply can't measure up. Let Phar Lap show you what a DOS extender should be.

Build multi-megabyte DOS programs with Phar Lap's DOS-Extenders!

286|DOS-Extender™ — it's never been so easy! With our 286|DOS-Extender and your Microsoft C, Borland C++ or Microsoft Fortran compiler, you've got all the tools you'll need to quickly and easily build multi-megabyte protected-mode applications — often by simply relinking without making source code changes. Now you can build protected mode applications that access up to 16 megabytes of memory on any DOS-based 80286, 386, 386SX, or i486 PC — without changing development tools! 286|DOS-Extender is also compatible with both Borland's Turbo Debugger and Microsoft's linker and CodeView debugger.

386|DOS-Extender™ — the ultimate in 32-bit power. 386|DOS-Extender turns DOS into a true 32-bit operating system with a flat, 32-bit address space. Your program can access all the memory available in the machine — up to 4 gigabytes! 386|DOS-Extender runs on any DOS-based 80386, 386SX, or i486 PC, and has been used in over 800 applications, including AutoCAD 386 and IBM's Interleaf Publisher. It is backed by a full complement of 32-bit languages, including C, C++, Fortran, Pascal, Ada and Assembler. With true 32-bit performance, you can finally build workstation-class applications for the PC.

Phar Lap Software: Chosen 10 to 1 over all other DOS extenders. Here's why:

| | Phar Lap DOS-Extender | Vendor A | Vendor B |
|------------------------|------------------------------------|-------------------------|-------------------------|
| Maturity | Over 5 years and 1000 applications | Less than a year | Brand new |
| Memory Model | Safe | Dangerous | Dangerous |
| Compatibility | INT 15, XMS, VCPI, DPMI | XMS, DPMI | XMS, VCPI |
| Library Support | Extensive list of 32-bit libraries | Limited library support | Limited library support |
| Documentation | Extensive and detailed | Limited | Less than 50 pages |

**640K
DOS
Barrier**

Shatter the 640K barrier and build multi-megabyte DOS applications.

**Overlay
Linkers**

No more suffering with overlays or EMS.

**Unsafe
Memory
Models**

Other DOS extenders can let common programming errors cause system crashes.

Finally, a CASE platform that move

CASEVision and IRIS Indigo— CASE like you've never seen it before.

You've known us as the company that builds hot graphics machines. Now we've taken that vision and applied it to CASE.

The result: we've created an intuitive, visual interface that reflects the way programmers think.

We've also included an entire suite of the most advanced and fastest C, C++ and

FORTRAN programming, compiling, debugging and analysis tools available today — designed for large, multiple-language, and even multi-processing applications.

Put all this on any of our award-winning IRIS Indigo™ RISC/PCs, and you've got the ultimate software development platform.

Where you go with all that power is completely up to you.

See for yourself. Get our CASEVision™ and IRIS Indigo literature package and find out where to check them out in person.

Fax a request with your name and complete address to U.S. (415) 962-1654* attn. dept. 12.

* The international operator can supply you with your country-specific code.

through code the way you do.

IRIS Indigo delivers 30 MIPS, 1.2 MFLOPS, 26 SPECmarks, CD-quality audio, 8-24 bit color, ACE-compatibility, and comes complete with color monitor, keyboard and mouse. Portable Presentations in Color

A portable desktop computer with its own color overhead projection LCD panel, the Mpression Notebook Presentation System uses standard overhead projectors to display computer text or graphics. The system consists of a 33-MHz 486 Mport 433 computer with a 120-MB IDE hard drive, plus the LCD panel.

The Mpression displays 256 colors from a palette of 187,000, automatically mapping the CRT colors. The system also automatically expands or compresses VGA modes of different resolutions to fit the 640- by 480-pixel LCD.

To install the system, you plug the cable from the LCD panel into the LCD VGA port of the Mport 433 (which has up to 32 MB of RAM), put the LCD panel on your overhead projector, and turn on the computer for simultaneous overhead and computer displays. The Mpression's 6-foot cable provides video signals and power from the Mport 433. Compatible with DOS, Unix, OS/2, PICK, and DR DOS, the system supports 410-W projectors with the light source below the LCD panel. **Price:** \$11,995.

Contact: Micronics Com-

An overhead presentation system, the Mpression Notebook Presentation System combines an LCD panel with its Mport notebook computer.

puters, Inc., 232 East Warren Ave., Fremont, CA 94539, (510) 651-2300; fax (510) 651-5612.

CPU in a Cartridge

Replaceable CPU cartridges form the basis of the PC Positive 1000 and 2000 upgradable systems. Four cartridges, ranging from a 20-MHz 386SX through a 33-MHz 486, fit either system; an internal CD-ROM is available as an

option for either system.

With 4 MB of RAM (expandable to 32 MB), the PC Positive 1000 base system has a 105-MB hard drive, 5¼- and 3½-inch floppy drives, a Super VGA color monitor with a video controller, a 2400-bps modem, a Logitech mouse, and six expansion slots. DOS 5.0, Windows 3.0, Microsoft Works for Windows, and Microsoft Productivity Pack are preloaded on the hard disk. WinFax is packaged with the system.

The basic PC Positive 2000 features 8 MB of RAM (expandable to 32 MB), a 200-MB hard drive, and a 9600-/2400-bps send/receive fax/modem. Prodigy is included, in addition to the software and accessories that come with the 1000 system.

Price: Basic PC Positive 1000, \$1400; basic PC Positive 2000, \$1900.

Contact: Positive Corp., 9174 Deering Ave., Chatsworth, CA 91311, (818) 341-5400; fax (818) 718-2938.

Circle 1272 on Inquiry Card.

Desktop System Packages Power

Packaged as a complete system, the ME 486-SX/25 desktop computer includes 4 MB of RAM (expandable to 32 MB via 70-ns SIMMs), 128 KB of 25-ns write-back cache RAM (expandable to 256 KB), an 80-MB hard drive, and dual floppy drives. The system's extended VGA card displays up to 256 colors at a resolution of up to 1024 by 768 pixels on a 14-inch nonglare screen.

The ME 486-SX/25's AMI BIOS offers selectable shadowing. The system has eight 16-bit expansion slots, five drive bays, and an upgradable motherboard.

Price: \$1999.

Contact: Micro Express, 1801 Carnegie Ave., Santa Ana, CA 92705, (800) 989-9900 or (714) 852-1400.

Circle 1273 on Inquiry Card.

Fast Transfer on the Local Bus

Built on the Opti Local/CPU Bus chip set, Bell's 40-MHz 386 system transfers data at the 40-MHz speed of the CPU rather than at the 8-MHz speed of the AT bus. Since the CPU has its own card, you can upgrade the system.

The system features 4 MB of RAM, 64 KB of cache memory, a 250-MB hard drive, a 1-MB local/CPU bus VGA card, and a 14-inch Super VGA monitor. Also included are one parallel and two serial ports, a mouse, DOS 5.0, Windows 3.0a, and dual floppy drives.

Price: \$3495.

Contact: Bell Computer Systems, 6615 Valjean Ave., Van Nuys, CA 91406, (800) 922-1126 or (818) 909-3501.

Circle 1274 on Inquiry Card.

To upgrade the PC Positive 1000 and 2000 models, just change the CPU cartridge.

Prolific Possibilities from a Printer

The 6-ppm PostScript Level II Silentwriter Model 95 laser printer has automatic emulation switching that detects PostScript and Printer Control Language files and automatically configures the printer for the proper language. The printer also has automatic interface monitoring that switches between active ports for simultaneous connection of multiple PCs and Macs.

The Silentwriter Model 95 has 2 MB of RAM (expandable to 5 MB). Its 16.7-MHz 68000 microprocessor includes a built-in PostScript Level II interpreter that provides 35 resident scalable typefaces. Built-in trays include a 15-envelope feeder, a 250-sheet cassette that accommodates 24-pound paper and transparencies, and a multipurpose tray that handles 41-pound paper.

An optional PostScript fax/modem lets you send and receive Group 3 faxes as well as PostScript faxes from the printer.

Price: \$1749; fax/modem, \$599.

Contact: NEC Technologies, Inc., 1414 Massachusetts Ave., Boxborough, MA 01719, (800) 632-4636 or (508) 264-8000; fax (508) 264-8673.

Circle 1275 on Inquiry Card.

Draw Multiple Uses from This Graphics Tablet

DrawingPad combines the capabilities of a digitizer, a graphics tablet, and a mouse. Available for the

Mac and DOS compatible, the Silentwriter Model 95 presents a plethora of printing possibilities.

Mac and the PC, DrawingPad lets you create original graphics on your computer as well as convert any paper-based graphical image into a digital form recognized by the computer. After the image is in your machine, you can edit it as you please.

The 2-pound DrawingPad has a resolution of up to 1270 lines per inch with accuracy at ± 0.025 inch. It includes 18 user-recordable macros, tablet-to-screen and proportional mapping capabilities, the capability to map the active tablet area to an active window on the screen, and a feature that lets you switch between the mouse and other modes without losing your place on the tablet. You can choose your input device from a number of cordless pen and cursor options.

Price: \$395.

Contact: CalComp, Inc., Digitizer Products Group, 14555 North 82nd St., Scottsdale, AZ 85260, (800) 458-5888 or (602) 948-6540; fax (602) 948-5508.

Circle 1276 on Inquiry Card.

Spill-Proof Keyboard

The Membrane Keyboard 101's washable membrane replaces the full-travel keys on a conventional keyboard, but in other respects it matches an Enhanced AT keyboard. Seven ounces of pressure is all that's needed to activate a key, which responds with a light click to let you know your touch was recognized. Interfaces include a keyboard port for an AT or PS/2 computer, an RS-232 serial port, a parallel port, and a universal terminal interface. The scan code serial and parallel versions are fully programmable.

Price: Basic keyboard, \$300; universal terminal version, \$350.

Contact: Genovation, Inc., 17741 Mitchell N, Irvine, CA 92714, (714) 833-3355; fax (714) 833-0322.

Circle 1277 on Inquiry Card.

Video Editor for Windows

The Editizer video editor from Technical Aesthetics Operations features true A/B roll and SMPTE time-code editing in Windows, as well as integrated tape logging and edit-decision list management support. The combination hardware/software editor encompasses an interface box and software that uses more than 10 independent pop-up windows, including three VCR windows, the Controller window, a Tape Logger window, and an Edit Decision window.

The object-oriented design of the Editizer gives you powerful and sensible access to your data. To change any time code, you click on the time-code number on the screen for a dialog box that lets you set a new number.

You can use the Editizer with your PC to log videotapes and edit, rearrange, and record productions using existing decks. You can connect multiple video decks to any PC that supports Windows and export the Editizer edit-decision list into an industry-standard CMX file to be used by a commercial postproduction firm. Interfaces include RS-232, RS-422, Panasonic AG-1960, and Sony Control-L.

Price: \$1995.

Contact: Technical Aesthetics Operations, Inc., 501 West Fifth St., Rolla, MO 65401, (800) 264-1121 or (314) 364-4925; fax (314) 364-5631.

Circle 1278 on Inquiry Card.

The Editizer, a Windows-based video editor, supports the full life cycle of a video production.

Upgradable Power from Predator

The Predator motherboard is 10 products in one. With a change of the CPU and setup jumpers, the board can be a 25-, 33-, or 40-MHz 386; a 20- or 25-MHz 486SX; a 20- or 25-MHz 487SX; or a 25-, 33-, or 50-MHz 486.

The 8½- by 13-inch Predator features selectable bus speeds and cache memory that is field upgradable from 64 KB to 128 and 256 KB. Able to support multiple operating systems running concurrently, the board is compatible with DOS, OS/2, Unix, and NetWare. Standard interfaces include two serial ports, a mouse port, a bidirectional parallel port, a dual-floppy controller, and an AT interface for IDE hard drives.

Predator's flash memory BIOS is upgradable via a floppy disk. The board, which ships with no system memory, supports up to 16 SIMMs, allowing system memory of up to 64 MB. **Price:** With 64 KB of cache memory, \$450. **Contact:** Deico Electronics, Inc., 2800 Bayview Dr., Fremont, CA 94538, (510) 651-7800; fax (510) 651-6109.

Circle 1279 on Inquiry Card.

Cross-Platform Media Compatibility

Based on Intel's Digital Video Interactive technology and 750B video processor, the EyeQ Delivery board compresses and de-

Deico's Predator takes on many configurations.

compresses 30-frame-per-second full-screen video to the hard disk on your desktop computer in real time. With 2 MB of video RAM (expandable to 4 MB) and four application-specific ICs, the NuBus board supports 12- and 13-inch Mac displays and multisync displays up to 16 inches (800 by 600 pixels). The board lets you play MacDVI media files on any DVI system.

The EyeQ Delivery board has a data transfer rate of 150 KBps and includes support for NTSC and PAL video standards. Other features include QuickTime compatibility, QuickDraw graphics acceleration, high-fidelity audio, video overlay, and support for multiple compression algorithms. **Price:** \$2495.

Contact: New Video Corp., 220 Main St., Suite C, Venice, CA 90291, (213) 396-4000; fax (213) 396-0282.

Circle 1280 on Inquiry Card.

Six-in-One I/O Board

Integrating the functions of six boards on a single board, the Sigma Six is designed for the AT bus. The board includes 10-Mbps Ethernet connectivity, a 9600-/2400-bps send/receive fax/modem, Super VGA with 1024- by 768-pixel noninterlaced resolution and a 70-Hz refresh rate, Windows 3.0 compatibility, DOS 5.0 software in flash EPROM, IDE and floppy drive controllers, and parallel and serial ports.

Price: \$695. **Contact:** Advanced Micro Technology Computers, Inc., 123 University Pkwy., Pomona, CA 91768, (800) 487-4539 or (714) 598-6120.

Circle 1281 on Inquiry Card.

Micro Channel Memory Enhanced

The BocaRAM.MCA32 memory enhancement board supplies up to 32 MB of SIMM memory to IBM 32-bit Micro Channel computers, letting them run operating systems such as DOS, OS/2, Unix, Xenix, and NetWare. The memory on the board can be extended, expanded, or a combination of both. Memory configurations are directed by a menu-driven installation program; the MC32TEST utility verifies that the board is working properly. A driver for EMS 4.0 is included.

Configurations of BocaRAM range from unpopulated to 32 MB. You can upgrade board memory by adding SIMMs.

Price: \$295 to \$3295.

Contact: Boca Research, Inc., 6413 Congress Ave., Boca Raton, FL 33487, (407) 997-6227.

Circle 1282 on Inquiry Card.

Display Adapter for PowerBooks

The Notebook Display Adaptor 030, an 8-bit display adapter for use with the Macintosh PowerBook 140 and 170, drives 13-inch color displays and projection devices that have up to 256 colors. With a pass-through memory port that accepts an Apple 2- or 4-MB memory upgrade, the adapter is available with or without 2 or 4 MB of RAM on-board. **Price:** \$795.

Contact: Envisio, Inc., 510 First Ave. N, Suite 303, Minneapolis, MN 55403, (612) 339-1008; fax (612) 339-1369.

Magic Fields™ for Windows

Save time by creating Windows data entry screens the easy way. Magic Fields is a large collection of objects that perform data field validation. Just point & click to define intelligent input fields (numeric, text, date, currency, phone no., etc). Fully customizable including fonts, colors & 3-D NeXT look. Extremely powerful. Use any Windows resource editor. No royalties.

A Case for the Mac PowerBook

Magenta Seven's MagentaCase padded carrying case for the Macintosh PowerBook is made of resilient Du Pont 1000-denier Cordura nylon and closed-cell foam to protect the notebook during travel. Pockets and pouches carry all accessories, such as the power pack and as many as five batteries. The case is designed so that you can use the PowerBook without removing it, easing the problems of computing while on a plane or in a car.

Magenta Seven automatically enters owners into a lost-and-found registry. Each MagentaCase is uniquely coded, so if it is lost or stolen and then recovered, the company can identify the owner. Owners may elect to register their PowerBooks with the company.

Price: \$119.95.

Contact: Magenta Seven, Inc., 5109 Holly Ridge Dr., Suite 209, Raleigh, NC 27612, (919) 787-2787; fax (919) 787-1277.

FDDI Tester

A hand-held, battery-powered Fiber Distributed Data Interface tester, the Model LCT 100 Link Confidence Tester can test FDDI links and stations to test networks and troubleshoot network problems. The LCT 100 tests protocols and optical performance, and you can use it to verify that your cable's performance is adequate for FDDI. The unit tests connection management and link confidence, as well as link error rate.

The MagentaCase comes in a variety of colors.

Price: \$5900.

Contact: Fotec, Inc., 529 Main St., Box 246, Boston, MA 02129, (800) 537-8254 or (617) 241-7810; fax (617) 241-8616.

Circle 1285 on Inquiry Card.

Give Intelligence to Your PC

The Intelligent Power Module automatically powers off your PC when your system finishes its unattended jobs. Activated by receiving on/off signals from your PC via a signal cable connected to the PC's parallel or serial port, the module sits in-line between a wall outlet and a power strip.

The Intelligent Power Module works by responding to the power-off command you've put at the end of the BAT file you use to run unattended operations. When the job is complete, your PC sends the signal to the module to shut down the system. The unit ships with software commands on a floppy disk and a signal cable to attach to your PC.

Price: \$59.

Contact: Server Technology, Inc., 2332-B Walsh Ave., Santa Clara, CA 95051, (800) 835-1515 or (408) 988-0142; fax (408) 988-0992.

External Blocking of ELF Radiation

ELF ProTech, an externally mounted, extremely low frequency magnetic field suppressor for video display terminals, reduces your VDT's ELF magnetic field to significantly less than the 2.5-milligauss guidelines prescribed by MPR II, according to NoRad. The shielding device is made of a highly specialized alloy, modified by NoRad to attract and absorb magnetic fields radiating from the monitor.

You can use ELF ProTech to retrofit an existing monitor without using special tools. When installed on the sides and top of the monitor housing, the device is transparent to the VDT's performance and does not impair image quality while it reduces ELF magnetic field strength from the front, back, sides, and top of the monitor.

Price: \$49 to \$99, depending on number of panels required.

Contact: NoRad Corp., 1549 11th St., Santa Monica, CA 90401, (310) 395-0800; fax (310) 458-6397.

Standby Computing Power

Available in 250-VA and 450-VA models, the Patriot standby power system is rated UL 1449 for its full-time lightning and surge protection. Patriot protects against high-voltage conditions by switching the load from line to inverter. The system provides full-time EMI/RFI protection via its advanced multistage filter for 33 dB of common-mode and 47 dB of normal-mode noise isolation. Two audible alarms and a triple-mode status indicator light to warn of overloads or a low battery are included.

The Patriot 250 VA supports small stand-alone computers, including the Mac SE/30. It can support a PS/2 Model 30 with a VGA monitor for 22 minutes.

The Patriot 450 VA has an interface port that lets it trigger a safe, orderly shutdown and includes CheckUPS software and automatic shutdown kits for operating systems such as DOS, OS/2, AS/400, NetWare, LAN Manager, LANtastic, and Unix/Xenix. The Patriot 450 can support a PS/2 Model 55 for 18 minutes or a Sun-3/60 system for 12 minutes.

Price: Patriot 250 VA, \$169; Patriot 450 VA, \$279. **Contact:** Best Power Technology, Inc., P.O. Box 280, Necedah, WI 54646, (800) 356-5794; fax (608) 565-2929.

Data Compression of course, but Which One?

Why not go with the real-time data compression software being used by more PC users worldwide!

Just install SuperStor 2.0 and you instantly increase your disk capacity by 2-3 times! Then use your computer the way you normally do, no extra commands or keystrokes are required.

SuperStor 2.0 provides up to 25% greater compression than before! It's the fastest, most advanced product of its kind, with many unique features that make it more powerful, easier to use, and far more flexible than the competition. Just look at the chart to review SuperStor's numerous features—many of which are not offered by other compression products.

SuperStor 2.0 is not only the most powerful, it's the most user friendly, too! Clear, colorful graphic displays make installing and using SuperStor simple. And, SuperStor 2.0 runs with all popular operating systems and application programs.

So when choosing data compression, SuperStor is the one!

Phone and Fax While on the Move

FaxPak, an integrated cellular phone and fax machine, uses a cellular transceiver from Motorola, ensuring reliable performance in remote areas, according to the company. With a five-page document feeder and 98-foot rolls of paper, the FaxPak provides easy faxing while you're traveling.

Compatible with standard office fax machines, the 1-ppm FaxPak FP-100B can be powered three ways: via its internal rechargeable batteries, a cigarette lighter adapter, or an AC 110-V adapter. The sealed lead-acid batteries recharge whenever the unit is connected to an external power source, permitting you to use it while the batteries are charging.

Price: \$2295.

Qmodem 5 Offers New Features

Version 5 of Qmodem adds a number of enhancements to the communications program. The major addition, the Off Line Mail Reader, lets you download packets of mail from an originating BBS and read them off-line at your leisure. The feature also lets you write your replies off-line and then upload them for sending.

New features in the Dialing Directory let you specify the directory entry setting, such as name of service, phone number, and baud rate, for automatic dialing of subsequent calls. Other additions to the Dialing Directory include the capability to attach notes to any dialing entry, automatically redial an unlimited number of entries, and sort your directory by an entry's name, phone number, or total number of calls.

Terminal emulations added to Qmodem include the IBM 3101, DEC VT52, and Heath Zenith 19. You also can now preconfigure the program for more than 90 commercial modems. The learn mode now lets you create automated scripts to record repetitive tasks. The scripts help you by automating common functions such as log-in sequences, transferring files, downloading messages, and sending replies.

Price: \$99.

Mini Modem for Portables

The ViVa 2400 Pocket modem lets you communicate with remote computers or time-sharing systems via your portable computer. The 6½-ounce, 2400-bps unit works in full-duplex mode over a dial-up or two-wire leased telephone line.

Able to automatically dial a call and answer incoming calls over the phone line from a remote system, the ViVa 2400 Pocket can redial a busy number and dial an originate-only modem. The four LEDs include a modem-ready light that indicates when the unit is receiving power, two lights that show when a carrier is detected and when the battery is low, and a light that indicates when the unit is operating at high speed.

The modem comes with communications software, a wall-mount power pack, and a 9-V battery. Software packages supported include Smartcom II 2.1, Symphony, WordStar 2000, PC-Talk, Crosstalk, and Sidekick.

Price: \$139.

LOOK AT THE INSIDE STORY ON POWER SUPPLIES.

What power supply is inside your computer? If you are like most people, you don't know, and frankly, don't care. But, because your computer's power supply is a critical system component, what you don't know, may hurt you. An inferior power supply can cause interference, rebooting, hard drive errors, and other nasty hard-to-track problems. So why take chances? Call the power supply specialists at PC Power and Cooling today.

Turbo-Cool 300

Ordinary Power Supply

HERE ARE TEN GREAT REASONS TO SELECT THE INDUSTRY'S BEST, THE TURBO-COOL™ 300 AND TURBO-COOL™ 450.

1. 50% TO 100% MORE POWER

The more power, the better! Our high-capacity units start drive motors with ease, run cooler, last longer, and allow for future expansion.

2. BUILT-IN LINE CONDITIONING

Turbo-Cool power supplies won't skip a beat when the line voltage sags. Their wide input range (85-135V, 170-270V) and heavy-duty input components protect your PC and its data from sags, surges and spikes.

3. FCC-B AND VDE-B LINE FILTER

A dual-stage EMI filter keeps electrical noise well below agency standards.

4. INDEPENDENT REGULATION

Turbo-Cool's superior independent-regulation design keeps output voltage tolerances 20 times tighter than that of an ordinary

power supply. This exceptional stability improves hard drive reliability during critical access periods.

5. ULTRA-CLEAN DC OUTPUT

A dual-stage output filter ensures that sensitive computer chips receive pure, low-ripple power.

6. PROTECTION CIRCUITRY

Our units offer the most complete protection from dangerous overvoltage, overcurrent, and short circuit conditions.

7. THERMASENSE™ COOLING FAN

The Turbo-Cool 300 features ThermaSense, our high-capacity, thermostatically-controlled, variable-speed fan. It's ideal! High-performance systems operate up to 35° cooler while standard ones run as much as 75% quieter.

8. UL/CSA/TUV APPROVALS

Our high-capacity units are safety approved by not only UL, but also by Canada's CSA and Germany's strict TUV.

9. TWO-YEAR WARRANTY

Turbo-Cools are designed and tested for MTBFs of over 100,000 hours. They come with a no-hassle 2-year warranty and a 30-day money-back guarantee.

10. GREAT VALUE

Loaded with premium features, a Turbo-Cool power supply will upgrade the performance of your PC or LAN file server at a retail cost of only 55¢ to 80¢ per watt. You'll be powered by a unit that is popular with award-winning PC manufacturers and recommended by experts such as the PC Magazine Advisor!

Introducing the best notebook computer

Best color display in a notebook. Ever.

In its review of our UltraLite® SL/25C notebook, *PC Magazine* said, "NEC is about to make the future of portable computing a whole lot brighter."

We couldn't agree more.

The best color display in a notebook. Ever.

The fact is, NEC is the first to offer an active-matrix TFT color screen in a notebook, and yet, in the words of *PC Magazine*, "its price tag rivals lower-quality passive-matrix offerings."

What's the difference

between active-matrix and passive-matrix color screens? One looks vivid, sharp and bright, like your desktop monitor. The other doesn't. One can be viewed from wide angles. The other can't. One is clearly the future of notebook computing. The other isn't.

The best processing technology in a notebook. Ever.

To quote *PC Magazine* once more, our SL/25C "has more going for it than just spectacular color. It's also one of the first notebooks to use Intel's new 25-MHz 386SL chip set."

The new chip provides all the processing punch of a 386 desktop PC. Offers intelligent power management for longer battery life. And runs even the most complex applications at

blazing speed. The 7.5 lb. SL/25C comes standard with 2MB of RAM (expandable to 10MB), an 80MB hard disk, internal floppy and 64KB cache. As well as MS-DOS® 5.0 and Windows™ 3.0, loaded and ready to run.

Just what exactly is active-matrix TFT display anyhow?

Active matrix TFT (thin-film transistor) display means that for each pixel on the screen, there is a tiny transistor. In the case of the SL/25C, that adds up to over 900,000 transistors covering the entire screen, forming the image. With each pixel controlled by its own transistor, the image is always in sharp focus, and far brighter than other screen designs permit. NEC has long been a world leader in display technology. And the SL/25C is one example of this.

It does everything a powerful desktop does. Except chain you to a desk.

There's a serial port, SuperVGA CRT port, PS/2® mouse port and optional internal modem. An enhanced parallel port allowing improved throughput for network connections. And an optional full-

function, portable Docking Station™ unit—with two expansion slots and a 3.5" drive bay—that not only turns the SL/25C into a desktop you can take anywhere, it also gives you other options, like fully integrating sound and image to create your very own portable multimedia platform.

A powerful argument for color, right here in black and white.

It also has a brilliant VGA display. A palette of over 225,000 colors. A fast screen refresh rate (so you never lose your cursor). And a "simultaneous video"

feature—so the image you see on your screen can also be viewed on an external video device, like a big-screen projector. All of which makes one thing perfectly clear: the SL/25C is truly the ultimate presentation tool.

Shown with optional Docking Station.

Call today.

Multiplatform Applications with Objects

WinTran uses a system of named visual objects, such as text, lists, images, or tables, rather than windows, to develop multiplatform GUI applications. The WinTran application code is written in standard programming language but is not tied to any particular windowing model. WinTran treats visual objects uniformly across GUI platforms, so you can port their associated applications across Windows, OS/2, Macintosh, OSF/Motif, and other platforms.

Price: Windows version, \$495.

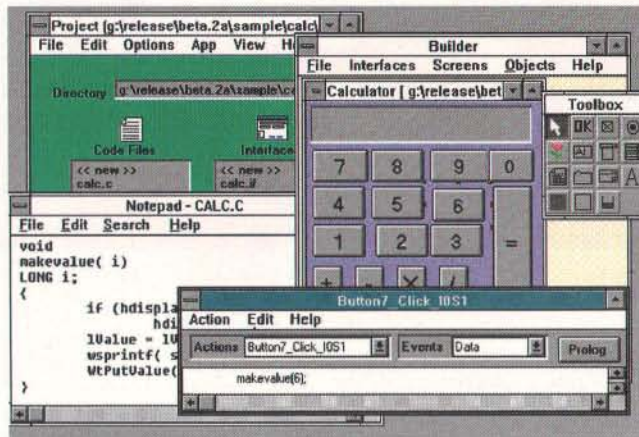

Contact: Guideware Corp., 2483 Old Middlefield Way, Suite 224, Mountain View, CA 94043, (415) 969-6851; fax (415) 969-3862.

Knowledge Garden Upgrades Its OOP Tool

Version 2.0 of the KnowledgePro Windows (KPWin) object-oriented programming environment features improvements to its design tools, dynamic link library (DLL) access, and Multimedia Extensions support.

The upgrade lets you use objects such as combo boxes

WinTran's Project Manager consolidates all the application elements and presents a visual map of the project as it develops. The Builder window on the right provides tools for building interface screens without your having to switch back and forth between programs.

or buttons by selecting them from a library, dropping them into a window, and applying attributes like size, color, and font. KPWin automatically generates alterable corresponding code. You can link your objects to external DLLs via one-line commands. This DLL support lets you access all the commands in the Microsoft Multimedia Developers Kit, the company reports.

Knowledge Garden also offers the KPWin SVW Video Toolkit, an add-in toolkit for controlling motion video in real time. The Video Toolkit works with New Media Graphics' Super VideoWindows overlay board.

Price: KPWin 2.0, \$249; SVW Video Toolkit, \$299.

Contact: Knowledge Garden, Inc., 12-8 Technology Dr., Setauket, NY 11733, (516) 246-5400; fax (516) 246-5452.

Circle 1300 on Inquiry Card.

Link and Swap Memory with Blinker 2.0

Said by its developer to be the only linker offering an integrated memory-swap function, Blinker performs linking and dynamic overlaying of programs written in Microsoft C, Zortech and Borland C++, and many other languages. Blinker 2.0 can also dynamically overlay the Microsoft BASIC PDS 7.1 development system. Blinker's memory-swap capability lets you use expanded or extended memory to save an executing program and then shell out and run a second program from within the first.

Price: \$299.

Contact: Blinkinc, P.O. Box 7154, Richmond, VA 23221, (804) 355-4444; fax (804) 355-1676.

Circle 1301 on Inquiry Card.

Add Neural Networking to Windows

NeuroWindows lets you incorporate neural networks into your applications. Release 2.0 adds real-time execution of supervised and unsupervised learning processes. The library lets you incorporate up to 128 neural networks within a single program. A driver that provides support for the company's NeuroBoard (a RISC-based board for speeding up network training time) is included in release 2.0.

Price: NeuroWindows, \$369; NeuroBoard, \$2000 to \$3100, depending on configuration.

Contact: Ward Systems Group, Inc., 245 West Patrick St., Frederick, MD 21701, (301) 662-7950; fax (301) 662-5666.

Circle 1302 on Inquiry Card.

A Video Library for C and BASIC

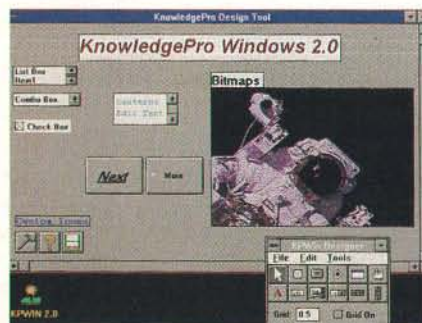

LiveWindows lets you write your own video-based applications in C or BASIC. The LiveWindows library lets you scale captured NTSC or PAL video to any size and display it in an on-screen window. The program lets you place VGA text or graphics on your live or frozen video.

The LiveWindows library is available for a variety of languages and compilers. A motion video board and VGA card with feature connector are required.

Price: \$395; \$995 with video board.

Contact: Software Interphase, Inc., 82 Cucumber Hill Rd., Suite 140, Foster, RI 02825, (800) 542-2742; fax (401) 397-6814.

The KnowledgePro Windows visual design tools come with source code. You can generate code interactively, amend it, and then feed it back to the design tool.

Raima Database Engine Captures Fortune 500 With Record Speed

Now Raima Data Manager™
Formerly *db_VISTA III*

Accelerated Database Performance

Compared to conventional relational databases, retrieval of records can be 10—20—even 50 times faster with Raima Data Manager from Raima Corporation.

Propelling The Biggest Names In Business

Companies like General Motors, Hewlett-Packard, IBM, Eastman Kodak, Rockwell and others are using Raima Data Manager in their competitive environments. Today's most critical, most demanding applications demand the high performance of Raima Data Manager.

Powerfully Efficient Leading-Edge Technology

Raima's combined technology merges the flexibility of relational databases with the lightning speed and efficient

Raima Data Manager™
The High Performance DBMS

Specifications

Relational B-tree indexing. Network data model. Relational SQL query and report writer. Single & multi-user. Automatic recovery. Built-in referential integrity. Supports: VMS, QNX, ULTRIX, UNIX System V, Berkeley 4.2, AIX, SunOS, SCO, MS DOS, MS Windows, and OS/2. Most C Compilers and LANs supported.

Raima Corporation 3245 146th Place S.E., Bellevue, WA 98007 USA (206)747-5570 Fax: (206)747-1991

Share Windows, Mac, or GEM Scheduling Data

With version 4.0L, Artemis Schedule Publisher offers real-time calculation of schedules, resources, and costs. The project management tool runs on Windows, Macintosh, or GEM systems and lets you share files among the three environments. Schedule Publisher 4.0L uses on-screen option boxes to automatically trigger scheduling data, such as placement of resources or descriptions within the project.

Integrated with Schedule Publisher is Artemis Presents 2.0A, Lucas's graphics presentation program. Presents lets you compile reports that include text files, scanned images, and CAD drawings.

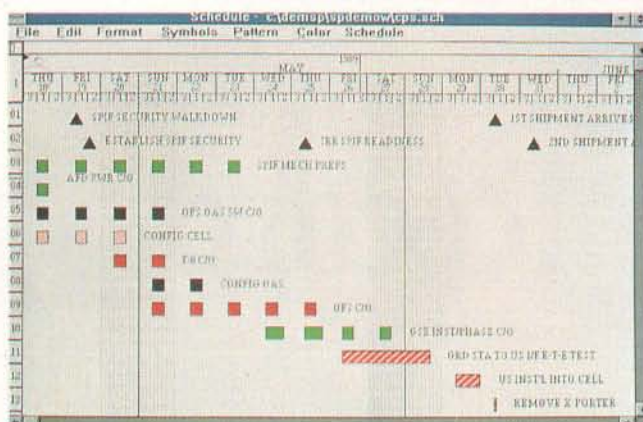

Price: Schedule Publisher, \$1995; Presents, \$995; both, \$2495.

Contact: Lucas Management Systems, Inc., 12701 Fair Lakes Cir., Suite 350, Fairfax, VA 22033, (703) 222-1111; fax (703) 222-8203.

Open new windows with TI microLaser™ printers.

And get powerful fonts and graphics, ease of use and more speed than ever.

By now you've heard how fast and easy Microsoft® Windows™ makes it to tap all that PC power you've got on your desk.

Well now there's an affordable, easy way to put that power on paper — microLaser from Texas Instruments.

Right out of the box, microLaser comes with what you need to print the dazzling pages of text and graphics you've dreamed of.

Just plug it in and go.  **POSTSCRIPT®**
That's because microLaser PS models come with PostScript® software from Adobe® and the memory it takes to use

it. Plus you get your choice of either 17 or 35 scalable fonts, starting at just \$1,399*.

New model. More speed. Same price.

When it comes to print speed, the new microLaser Plus zips along at 9 ppm. If you need a shared printer solution, turn to the 16 ppm microLaser XL.

If all that isn't enough, just look at what else you get with microLaser. It's the smallest printer in its class. It handles more paper and envelopes in more ways. And it supports more than 4,000 software packages, including your Windows applications.

So when you add it all up, you'll understand why the power of your ideas needs the power, convenience and economy of microLaser. Let microLaser open new windows for you.

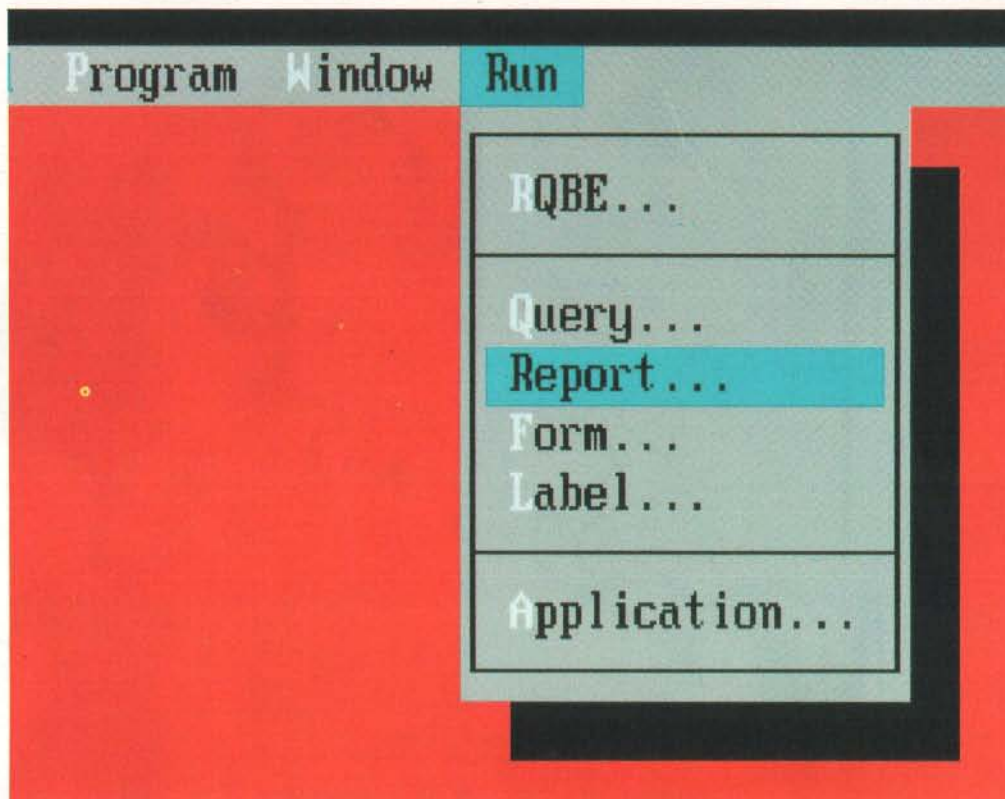

For the name of the nearest dealer, call
1-800-527-3500.

Circle 130 on Inquiry Card.

See Fox *RUN*.

We've just added a new word to the database vocabulary: *RUN*.

And it can make you a master of your database management universe. Even if you've never managed a database before.

The most powerful PC DBMS available is now the easiest to use, too: FoxPro™ 2.0.

Pick *Run* from the FoxPro 2.0 main menu and you have instant access to your information. Click on *Report*, choose the name of the report you want, and it's yours. Do the same for queries, forms, labels and applications.

For answers on-the-fly, pick *RQBE* (Relational Query By Example) and get a simple interface for creating custom queries quickly and easily. Unlike other query systems, RQBE lets you browse the information or create instant databases, reports, labels, or business graphs (with optional FoxGraph or other graphic program).

Custom systems are easy, too.

You create quick reports, forms, labels and applications by clicking on the *New* button in the dialog box instead of picking a name from the list.

Then using our simple tools, you build forms containing buttons, lists, check boxes, text regions and data fields. Reports with headers, footers and

subtotals. And even complete applications.

All without any programming.

So while it's the most powerful DBMS you can get today, it's ideal for small businesses and large. In industry or government. For invoicing and inventory control, order entry and accounting, and all your data handling needs.

FoxPro is the state-of-the-database-art.

FoxPro 2.0 is the object-oriented, event-driven DBMS programmers have been waiting for, too.

We've added over 100 new and enhanced commands. 4GL (Fourth Generation Language) tools for creating screens, reports and menus as reusable application objects. And the ability to attach entry and exit procedures to fields, forms and windows for pre- and post-processing.

We've integrated SQL SELECT, UPDATE and CREATE TABLE into the language, with the ability to use RQBE for creating SELECT statements you just cut and paste into your application code.

We've added a project manager on top of our debugger, trace window, and editor.

We provide an Application Program Interface (API) that links to C or assembler function libraries (Library Construction Kit optional).

And we offer an optional Distribution Kit to distribute your applications royalty-free.

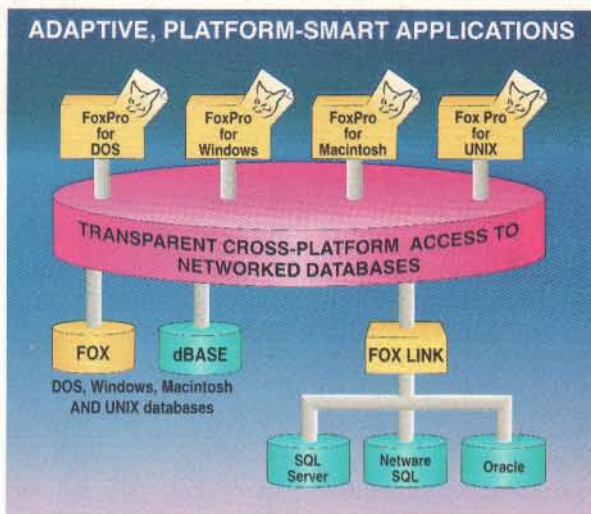

Today's best choice for upgrading or downsizing critical database applications.

FoxPro is devastatingly faster than competitive products (see chart†—the difference is even greater in single-user tests), and has out-queried even mainframe databases like Oracle, XBD and DB2, using our patent-pending Rushmore™ query optimization.

It's backward compatible with dBASE III+/IV and earlier versions of

Fox software to protect your investments in hardware, software, training, and support.

And in the few months since its release, FoxPro 2.0 has swept the awards. Best DOS Application - Spring COMDEX. Technical Excellence -PC. Award of Excellence -Byte. Best DBMS -Data Based Advisor. And many, many others from both editors and users of FoxPro 2.0.

Applications developed today with FoxPro for DOS, unlike other databases, will be able to run under Windows and SCO/UNIX and on the Macintosh when we release our new versions of FoxPro later this year.

Get a headstart on tomorrow today.

Today, FoxPro exchanges data with FoxBASE+ on Macs and on PCs running SCO UNIX. Later this year, FoxPro will be available for Windows, UNIX, and the Mac, all with access to Netware SQL, SQL Server, and Oracle databases.

And applications written using FoxPro's 4GL tools will be platform-adaptive, so DOS or Windows applications will run on UNIX or the Macintosh, and vice-versa.

Which means you can get a headstart on your future by starting your Windows, Mac or UNIX development now with FoxPro on your current DOS PCs.

It comes with a 60-day money-back guarantee.

So pick up a copy of FoxPro 2.0 at your nearest computer or software store. Try it out for 60 days, then if you don't like it, just return it to your dealer for a full refund.

But we think you'll agree with Byte magazine in their 1/92 review of dBASE: "...FoxPro is the better product."

Call 1-800-837-FOX2 today.

Animate Your Spyglass Data Models

A new scripting capability enables Spyglass Transform 2.1 for the Macintosh to create animated images from your plotted data. Scripting lets you automate Transform commands and batch-process your 2-D data files. Because the program accepts Apple events, you can run Transform commands from other applications. The template feature lets you save Transform commands performed on one data set and execute them later on another data set. According to Spyglass, the program performs five to 10 times faster than the previous version.

Transform 2.1 lets you control orientation, axis location, and labeling. You can run plot animations as PICS, HDF, or PICT sequences. **Price:** \$495.

Contact: Spyglass, Inc., 701 Devonshire Dr., C-17, Champaign, IL 61820, (217) 355-6000; fax (217) 355-8925.

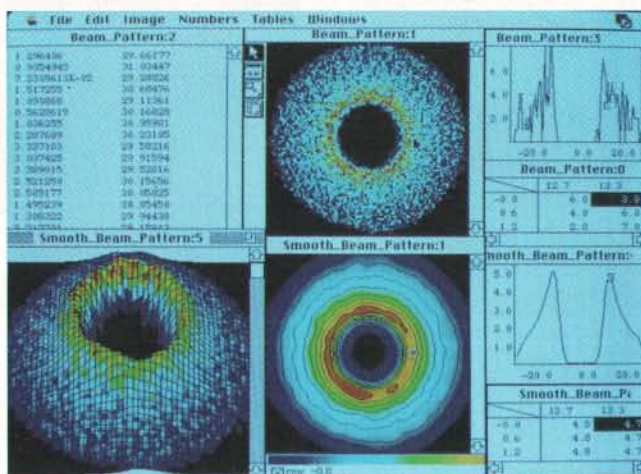

Circle 1309 on Inquiry Card.

Turn Your Monitor into a Meter Display

PCI-meter lets you display analog data on-screen as digital and analog meters and bar graphs. You

PCI-meter, here displaying a digital meter (lower right corner), an analog meter (bottom center), and bar graphs (left and top).

You can scale Spyglass Transform colors to represent actual numeric values.

can run up to 16 meters simultaneously, and you can set high and low alarm points for each meter. If you so desire, PCI-meter can be configured to trigger digital outputs as your data reaches the setpoints. You can save meters to your PCI-meter application files and reconfigure them at any time.

PCI-meter runs under Windows 3.0 or higher. The program acquires data for analysis via an Intelligent Instrumentation I/O board, and it can export the results to Microsoft Excel spreadsheets using Dynamic Data Exchange.

Price: \$95.

Contact: Intelligent Instrumentation, 1141 West Grant Rd., MS 131, Tucson, AZ 85705, (602) 623-9801; fax (602) 623-8965.

Math Modeling with Expanded Graphics Tools

Matlab 4.0 merges numeric computation software with application-specific tools and graphics capabilities to provide a mathematical modeling tool with a variety of analytical functions. Enhancements to the X Window System program include sparse matrix support, support for data import and export via any arbitrary file format, and sound output.

Version 4.0 provides tools for analyzing and visualizing data, as well as optimizing engineering system designs and algorithms. You can use Matlab 4.0 to create mathematical models, solve systems of equations, and perform general computations. The program lets you create and animate 3-D graphs using rectangular, spherical, and general parametric coordinate systems.

Matlab 4.0 is available for the Sparcstation; Hewlett-Packard 900/300, 400, and 700; IBM RISC System/6000; DECstation Ultrix; and Silicon Graphics

workstations.

Price: \$2995.

Contact: The MathWorks, Inc., Cochituate Place, 24 Prime Park Way, Natick, MA 01760, (508) 653-1415; fax (508) 653-2997.

Circle 1311 on Inquiry Card.

Develop and Plot Systems of Equations

With VisSim for Windows, you can turn the most convoluted equation into a sensible data model. VisSim lets you build flow-chart-style programs from data blocks and connect the blocks with function-performing FlexWires. Once you've developed your program (e.g., for representing the cycles of a bouncing ball or the flow of blood in the human body), VisSim plots it against a time element. Version 1.1 lets you alter your data model by using a slider control to adjust the source data.

You can save your VisSim models as screens and export them to Windows applications such as Word-Perfect. The program lets you import and export ASCII data files, and you can print your models on all Windows-supported output hardware.

VisSim lets you build model programs that contain up to 16,300 data blocks. Visual Solutions also offers a personal version with a 255-block limit. The company recommends using a math coprocessor with VisSim.

Price: Professional version, \$895; personal version, \$190.

Contact: Visual Solutions, Inc., 487 Groton Rd., Westford, MA 01886, (508) 692-5499; fax (508) 692-3102.

PERSONAL COMPUTERS

RISING STARS

Imagine. An award-winning range of personal computers and graphics workstations, whose power can be upgraded by simply changing an inexpensive processor card.

Designed and built to a quality normally associated with far more expensive brands.

Produced and supplied direct to the end user by a leading manufacturer with a reputation for professional Technical Support, as well as in-depth expertise in connecting computers together.

From a 33MHz 386 to a mighty 50MHz 486, the Elonex PC upgradeable range now offers the kind of performance that most people only dream about.

It takes Innovation to turn Imagination into Reality

Finansa Delivers Windows 3.0 E-Mail Solution

U.K. company Finansa has developed what it believes is the first Novell- and Windows 3.0-based E-mail system specifically developed to make full use of a GUI. Gavin Whichello, managing director of Finansa and a former vice president of Gupta, claims that too many current E-mail products are developed for text-based systems and have a GUI bolted on. He believes that Finansa's WinMail software is the first to truly capitalize on the ease of use offered by the Windows 3.0 environment.

WinMail is little more than a Windows 3.0 dynamic link library—a library of functions that are loaded into memory only when you call them. DLLs shield machine-specific hardware configurations from the application programmer. The programmer simply calls the function with the correct parameters, and the DLL controls the hardware interface. In this case, the DLL not only shields the hardware but also provides a simple interface mechanism that lets any application benefit from the mail system. For example, Microsoft's Word for Windows has an internal macro language that provides direct access to DLLs.

Finansa includes a 10-line macro with WinMail that lets you send the current document to any user with a single menu selection. You don't need to type in the filename or directory; WinMail requires only the name of the recipient. The DLL, under the macro's control, performs the file transfer and automatically generates an E-mail message informing the recipient that the file has arrived. Through this DLL interface, many other Windows 3.0 applications can be integrated with the E-mail system with little effort. People familiar with user programming tools like Visual Basic know that most of them support DLLs, making the creation of simple WinMail-based E-mail applications easy.

WinMail is also shipped with its own mail manager, which shows what is possible with the DLL interface. It supports multiple mail baskets and has a mail filter that attempts to sort the messages you receive into the correct mailbox. For example, you can set up WinMail to recognize words within the text of the message and then tell the mail filter to place every message with the word *meeting* in it into your meeting directory. With intelligent standardization, most organizations should be able to educate their staff to use standard keywords so that mail gets sorted correctly.

The need for sorting is perhaps not apparent to those who have not used a companywide E-mail system. Often carbon-copy lists include hundreds of people who do not need the information. An example comes from a bank with offices around the world: Some users found themselves being warned about fire-alarm tests in buildings on the other side of the world. In some departments, users were receiving upward of 100 messages a day, the majority of which were of no interest at all. Without mail sorting, this problem can become so bad that a mail system becomes unusable. Finansa's WinMail claims to solve it.

Psion's Practical Pocket Modems Travel Throughout Europe

Psion Dacom, the communications division of the palmtop computer maker, has launched a range of portable modems aimed at the European market. The neatly styled modems include some

innovative power management technology and an ingenious solution to using a modem anywhere in Europe.

Each modem in the range is divided into two sections: The top half contains

NANOBYTES

IBM, which has yet to ship a **laptop computer** that anyone really wants to buy, has finally found a way to get its hands on laptops that consumers like. In a complicated \$100 million deal with the French government and the French manufacturer **Groupe Bull**, IBM has agreed to take a minority stake in Groupe Bull. As part of the deal, Groupe Bull will gain access to IBM's RISC technology, and IBM will be able to resell Zenith Data Systems' notebook, laptop, and portable computers. (Groupe Bull purchased Zenith in 1987 for approximately \$500 million. Last year, Zenith's sales were about \$1 billion.)

IBM will also gain access to Groupe Bull's multiprocessor technology, while Groupe Bull will be permitted to join IBM, Motorola, and Apple in the Austin-based Computer Design Center. □

Advanced RISC Machines has announced another source for its ARM (which originally stood for Acorn RISC Machine) range of CPUs. **GEC Plessey Semiconductors** will be producing the chips at its U.K. plant in Plymouth. GPS becomes the second manufacturer of the chip set, along with **VLSI Logic**, the U.S. manufacturer and distributor of ARM products.

The move will please Apple, which forced Acorn to spin off the ARM semiconductor products in 1990. This was done to let Apple design systems around the chip set, safe in the knowledge that the chips were marketed by a company outside the control of one of its potential competitors. What Apple will use the chip set for remains a mystery; however, Apple CEO John Sculley revealed in Las Vegas in January that Apple was working on a range of consumer-oriented products. □

the modem chip set, software, and personal computer interface, while the bottom half contains the line interface and the telephone connector. By separating the line interface from the rest of the modem, you only need to modify the bottom half to meet the telecommunications requirements of each European country. Furthermore, you can buy the line interfaces separately so that you can use the modem in any country you have the line interface for.

The modems' power comes from a pair of 1.5-V AA-size batteries located in the top section of the unit. This is a major change from modems made by other manufacturers, which nearly always use 9-V batteries. The 9-V battery is not always a successful solution: One BYTE editor has a portable modem that has never worked on its 9-V supply. My own experience suggests that once the

battery voltage slips below 9 V, operation becomes erratic.

One problem is that a DC regulator often controls the voltage and simply throws half the power away. Psion solves this problem by using a DC-to-DC converter that steps the voltage up to 9 V, removing the need for a voltage regulator and making more of the battery power available to the new modems. Psion has also included many of the power-saving facilities found in the Series 3 machine. The company claims that the batteries can power the modems for approximately 10 hours of on-line operation.

The rest of the features are fairly standard for pocket modems. The modems support Group 3 fax, MNP level 5, V.42, and V.42bis. A stylish LCD panel at the top end of each unit indicates the modem and line status.

—Andy Redfern

PK Electronics Manages Workers' Playtime

During a visit to Singapore, BYTE editors were introduced to the management and manufacturing techniques of PK Electronics. Founded in 1982 by Loh Pit-Kin, PK Electronics established itself as a manufacturer of uninterruptible power supplies. Although it's still focused on UPS products, PK Electronics will soon be offering a backup hard disk device that attaches to your computer's parallel printer port and a printer-sharing unit for LANs.

PK Electronics promises a delivery time of four days to any destination in the world; Loh has taken the money that he could have spent on keeping an inventory of finished products and invested it in the manufacturing equipment and in the personnel required to assemble products on demand. The company stocks only the subassemblies and parts necessary to assemble products. Furthermore, many components are used in multiple prod-

ucts, minimizing the variety of parts the company must keep at hand.

Of course, this structure means that employees in the company's manufacturing division experience alternating cycles of activity and inactivity. This has forced the company to learn how to manage employees' free time. Loh recognizes that the periods of inactivity could result in employee boredom that might spill over into times when productivity needs to be high; thus, the company permits employees to play computer games during lulls in the production cycles.

Regardless of whether you consider such techniques frivolous, PK Electronics' four-day delivery indicates that the company is doing something right. The UPS products are primarily sold in the Pacific Rim area, and sales have been good, thanks in part to the poor quality of electrical power in Malaysia.

—Rick Grehan

Mapping Your European Markets with MapInfo

Geographical Information Systems (GIS) has traditionally stressed geography rather than information. This has led to high-priced software suitable only for specialist applications. MapInfo, a U.S. manufacturer, has recently launched its mapping software on the European market at a price that should allow desktop mapping to be used on a far wider scale.

MapInfo has negotiated many deals

that let the raw data, which makes mapping systems useful, be available at much lower prices; for example, up to now, GIS users wishing to buy map data in the U.K. had to pay up to £50,000 for Ordnance Survey data. Now, MapInfo has divided its data into more manageable chunks. You can buy a map of German postal codes or French main roads without investing in more than you need. ■

—Andy Redfern

NANOBYTES

Japanese consumer electronics giant Sanyo has launched a new range of notebook-class machines fitted with the Intel 387SX coprocessor as standard. The M series machines are aimed at people who need to process numbers while on the move (e.g., spreadsheet users). The machines are around £100 more expensive than equivalent machines without the coprocessor fitted—odd, considering that the discount price for a 387SX is around £65. □

Neural networks are considered to be the most appropriate solution for AI applications because of their similarity to the human brain's operation. To communicate, neurons in the brain send nerve pulses to each other, and the flow of the current between the voltages, ions, and neurotransmitters govern the electrical behavior of the neuron and its related nerve pulses.

Researchers at Oxford University and Caltech (Pasadena, CA) have developed an electronic neuron that uses analog technology. The analog silicon neuron uses CMOS circuits to simulate the ion currents flowing to and from the neuron. The external electrical properties of the real and fabricated neuron are nearly the same. The researchers designed the neuron to emulate a specific neuron in one part of the brain, but because a small electronic circuit simulates each ion current, the silicon neuron can replicate virtually any type of neuron.

The researchers have found that the speed of the silicon neuron is 1 million times faster than that of its biological equivalent; however, the speed and dynamics of the device will need to match the real neuron if it is to accurately simulate the neuron's response to external stimuli.

The silicon neuron is really a first step toward a truly practical analog computer. Those who have been saying for the last 20 years that digital computing is a side issue may still prove to be correct. ■

BEYOND TURBO

ANNOUNCING **PASCAL⁺**TM

A High Performance Option For Turbo Pascal Users

We agree that Borland Turbo Pascal® is a great street machine. But when your applications demand the ultimate in performance, the **Stony Brook Pascal⁺** optimizing compiler has the extra power you need — and an unbeatable list of standard features.

DON'T CHANGE A LINE OF YOUR CODE

It couldn't be easier to trade up to Pascal⁺. We're 100% language-compatible with Turbo Pascal V6. **You don't change your Turbo Pascal programs at all.** Just compile with Pascal⁺ and get:

Execution speeds up to 100% faster
Code size up to 30% smaller

You get fully optimized code with **NO** difference in your program's operation!

ELIMINATE ROADBLOCKS

Pascal⁺ comes fully equipped to handle ANY programming problem you encounter. Unlike Turbo Pascal, we produce standard Microsoft® objects, support all memory models, and give you complete control over procedure-calling and parameter passing conventions.

INSTANTLY LINK TO OTHER LANGUAGES

With Pascal⁺ it's easy to interface with code written in any other language. This means, for instance, that you can have immediate access to millions of lines of commercial library code written by and for C programmers.

AND WE DO WINDOWS!

Stony Brook Pascal⁺ comes with full support for Microsoft Windows 3.0.

We provide the interface units, and you use the windows API exactly as you would with Microsoft C.

In fact, anything you can do with Microsoft® C or TurboC®, you can do with Stony Brook Pascal⁺!

So get on the track with Stony Brook Pascal⁺. You'll qualify for races you never could enter before.

CALL NOW OR WRITE FOR INFORMATION

Bubble-Jets with a Common Pedigree

ANDY REDFERN

**Can two printers
with equivalent
print quality differ
in usability?**

er the ideal accompaniment for portable computers.

Both Citizen and Fujitsu have launched bubble-jet printers that compete directly with the HP DeskJet. Although externally different, the Citizen ProJet and the Fujitsu Breeze 200 bear more than a passing resemblance internally. A short investigation into the pedigree of each printer reveals why.

Three major manufacturers—Olivetti, Canon, and HP—develop bubble- or ink-jet print heads worldwide, and all other manufacturers of bubble-jet printers buy their print heads from one of them. Fujitsu and Citizen use the Olivetti print head, but the technology transfer doesn't stop there.

The firmware that controls both the ProJet and the Breeze 200 is almost the same, with the printers producing identical test pages. It turns out that both Citizen and Fujitsu sourced most of their printers' components from Olivetti; Citizen

The launch of Hewlett-Packard's DeskJet printer brought high-quality printing to the masses. Previously, a laser printer was the only option for users who needed high-quality printing, but the neatly packaged DeskJet changed that. Now, other companies, including Canon, have created even less expensive and lighter options, making a bubble-jet printer

designed a different case and interface, and Fujitsu made a few changes from the original Olivetti design. With this in mind, comments about print quality and speed apply to both the Fujitsu and Citizen printers equally.

The Fujitsu and Citizen printers come with 26 fonts, including Courier, Letter Gothic, and Times Nordic. Although 26 sounds impressive, once you realize that Courier, Courier Bold, and Courier Italic are all considered different fonts, the number looks rather ordinary.

These printers are driven using a firmware emulation of the HP DeskJet. This emulation includes support for the HP LaserJet print commands as well. The Olivetti print head's printing quality is certainly as good as that of the HP. In fact, I found that as long as I used identical paper, the output from the HP and Olivetti print heads was of equal quality.

Paper is an important factor when considering the use of a bubble-jet printer. Low-quality paper has a furry surface, so ink bubbles slightly splatter when they leave the print head and land on a page. My tests suggest that, using good paper, a bubble-jet printer's output is equal in quality to the output of an inexpensive laser printer. The bubble-jet can also print on both sides of the paper without the paper jamming the printer.

The print-head drive mechanism is rated at over 300 characters per second in draft mode. Tests showed that this figure refers only to the burst print speed of the print head. The figure also does not take into account line feeds, page feeds, and printer initialization time.

A plain text file containing two pages of text printed at an average rate of around 100 cps in high-speed draft mode. In high-quality print mode, a four-page document containing 11,000 characters printed at a rate of around 60 cps—a little quicker than 1 page per minute. In graphics mode, a simple pie chart with almost no text slowed the print rate down dramatically, taking 2 minutes to print from Quattro Pro. More complex images took up to 10 minutes to complete, with long periods of inactivity that left me wondering whether the software or the printer had crashed.

Both the Citizen and Fujitsu printers let you add fonts and memory to the base system, in a way similar to that of the HP DeskJet. Extra memory should help with printing graphics files, because even

Photo 1: To set up the Citizen ProJet, you simply unpack the parts, drop in the print head, plug in the cables, and fill the paper tray.

Photo 2: Although internally similar to the ProJet, the Fujitsu Breeze 200's case looks more robust due to the use of ribbed plastic and a squarer design.

though the print speed won't increase, the extra memory will let the host computer send more data to the printer, freeing it up more quickly for other tasks.

The ProJet

The Citizen ProJet printer (see photo 1) is neatly styled, with a sloping top that makes it look smaller than other printers. A clear plastic screen protects the print head and lets you monitor the print job's progress. This proved to be useful, because complex images can take several minutes to print and spotting a mistake early saves having to wait for the whole page to finish before you can reset the printer and try again. The paper feeds into the printer from a tray on top and exits onto a tray at the front.

The back of the printer includes the power input and switch and the parallel interface. An optional serial interface is available, but to fit it, you must dismantle the machine. If you need a serial interface, I recommend that you buy the printer and the serial card from the same dealer and have them install the card for you. The excellent setup utility lets you control the external ports, including the data transfer rate.

I found setting up the printer to be remarkably easy. After unpackaging all the bits, you just drop the print head into place, plug in the cables, and fill the paper

tray. In about 2 minutes, a test print reveals that the printer is functioning correctly.

Compared to setting up a laser printer, I found setting up the ProJet and replacing the only consumable (i.e., the print head) very easy—in fact, setting up the ProJet is simpler than changing the ribbon on many typewriters. This is perhaps more of an advantage than it may seem. In a large organization, users, rather than computer-service departments, can perform installation and basic maintenance procedures on the printer, providing an obvious savings in staff costs.

In use, the ProJet is quiet, with only the whir of the print head and the sheet feeder actually audible. In draft mode, the printer seems louder, but this is simply due to the greater speed of the print head.

The feature that distinguishes the ProJet from the Breeze 200 is in the way you select and control its functions. It is not economical to have an LCD panel on budget printers, so most manufacturers resort to a complex array of multifunction buttons with colored labels to indicate what the button does in each mode. Citizen has sidestepped the need for an LCD panel on the ProJet with its Command Vue control panel.

The Command Vue control panel has four clear plastic windows, each of which, through the use of a slide mechanism, dis-

plays any one of four labels. Alongside each label is a button and an LED. When a label is shown, a button functions as described on the label. This lets each button perform four tasks, to give a total of 16 functions without any real confusion.

Also, if a button toggles a mode (e.g., the printer on-line button), an LED alongside the display reflects that button's state. This is the one element of this interface that can be confusing. The on-line LED will not be visible if one of the other four possible lists of functions has been selected, so if the printer doesn't print, it may take some time to figure out that it's off-line.

Having said that, I'll add that this is a neat interface that meets the budget requirement without compromising on usability. The print quality and ease of use make the ProJet a capable budget printer.

The Breeze 200

Although internally similar to the ProJet, Fujitsu's Breeze 200 (see photo 2) looks far more robust externally. This is probably due to the use of ribbed plastic and a squarer design.

The paper feeds into the printer from a rather fiddly tray on top and then exits into a drop tray, similar to that of the DeskJet, at the front. The power input and switch and the parallel interface are located toward the rear of the machine. An optional serial interface is available, but as with the Citizen, I suggest you get the dealer to do the rather tricky upgrade.

The right side of the printer contains an array of LEDs, multifunction switches, and two slots for the upgrade cartridges. The printer uses colored labels to define which button performs which task. I found the interface confusing, and some of the functions were difficult to remember (e.g., when the printer is off-line, the on-line LED is lit). Obviously, the lit LED meant that the printer was off-line. So, why not have the LED light when the printer is on-line and not light when the printer is off-line? You can also select fonts by lighting combinations of LEDs; seven buttons control 18 possible combinations.

Although the interface was confusing, it was no worse than those of many other printers I have seen. I quickly got the hang of the tasks that I performed regularly (e.g., sheet feed), but I had to keep resorting to the manual for tasks I performed less frequently.

Fujitsu Creative Faces

To differentiate the Breeze 200 from Citizen's and Olivetti's offerings, Fujitsu has

THE POWER.

Disk operating system DR DOS 6.0. Unleashes PC power. Doubles hard disk space. Increases speed of PC operations by up to five times. Maximises memory. DOS, Windows compatible. Science/magic. Great reviews. For more information, call one

NEWS

INTERNATIONAL FIRST IMPRESSIONS

developed some software to bring out the best in this printer (and its 24-pin dot-matrix printers). Fujitsu Creative Faces (FCF) is an application that lets you use either 13 or 35 scalable fonts in any Windows 3.0 application.

Working much like Adobe Type Manager, FCF displays the fonts in true WYSIWYG on the screen. It also controls the output of the fonts to the printer. It converts the scalable screen fonts into a

bit-mapped image that can be printed on any HP-compatible printer or any Fujitsu dot-matrix printer. The documentation is far from simple, but once the new fonts are installed, they are available as standard Windows 3.0 fonts, so virtually any application can use them.

Using Word for Windows, I experimented with FCF and found its screen and printed results very good. Also, because FCF uses standard Bitstream fonts, you

can add any other fonts you may need.

FCF is available separately, so you can use it to add extra functionality to other dot-matrix, laser, and bubble-jet printers. I used it with an Epson GQ-3500 laser printer and the ProJet and found that both worked as well as the Breeze 200.

In general, the Breeze 200 is a solid printer with an excellent print engine. Its control interface, however, is disappointing. Unfortunately for Fujitsu, Citizen's ProJet uses the same printer engine and bubble-jet print head as the Breeze 200. Although the print quality of both machines may be equivalent, the usability certainly isn't. And if you're tempted by FCF, you may find that the software drives the printers that compete with the Breeze 200, and that these may well offer better value for the money. ■

Is ARCnet too slow...?

Not with ARC ARRAY™

The new ReadyLINK ARC ARRAY adapter from COMPEX can increase your ARCnet network's throughput as much as eight times. This means a maximum network throughput of 20 Mbits/sec. compared to standard ARCnet's 2.5 Mbits/sec., Ethernet's 10 Mbits/sec., and Token Ring's 16 Mbits/sec. And, you can keep the same standard ARCnet adapters in your network workstations and the same standard ARCnet cabling and hubs.

ReadyLINK ARC ARRAY achieves this advantage by using the unique

COMPEX INC., U.S.A.

COMPEX Multiport LSI ARCnet design. Because it uses only one ARCnet node address and receives data as a single node, ReadyLINK ARC ARRAY receives data at 2.5Mbits/sec. but transmits over up to eight separate channels for an aggregate transmit throughput of 20 Mbits/sec. Since, in a typical network, the file server spends over 90% of its time transmitting and less than 10% of the time receiving, your ARCnet network with ReadyLINK ARC ARRAY leaves comparable networks in its dust.

Browsing Art the Windows Way

DICK POUNTAIN

The Iconclass Browser has the power of a well-constructed hierarchical classification system

that you don't anticipate in your search criteria.

The company's definition provides some help: "Iconclass is an iconographic classification system built on transparent hierarchical principles." Thus, Iconclass is a system for classifying images (originally paintings) on the basis of their content or subject matter. The Iconclass system is already used for many of the world's most important art collections, including those in London's Courtauld Institute and the Getty Trust in Santa Monica, California.

The hardest part of writing about the Iconclass Browser is explaining exactly what it is. Iconclass is not a database, but it contains a large amount of data; it's more than just a query language, but it enables you to construct extremely powerful queries; it's not a hypertext system, although it has powerful cross-referencing abilities; and it's not an expert system, but it has the ability to uncover connections

Iconclass was the inspiration of the late Henri Van de Waal, professor of art history at the University of Leiden in Holland (a country that, incidentally, is host to many of the world's finest paintings). A team of scholars researched and developed the Iconclass system over a period of 40 years and published their findings in 17 volumes between 1973 and 1985. In 1990, the Dutch Ministry of Science and Education sponsored a team at the University of Utrecht (the Iconclass Research and Development Group, or IRDG) to produce a computer-readable version of Iconclass, and the fruit of that work is a Microsoft Windows application called the Iconclass Browser. If you need proof that the PC revolution has been won, here it is: Just five years ago, this program would have been designed for the VAX.

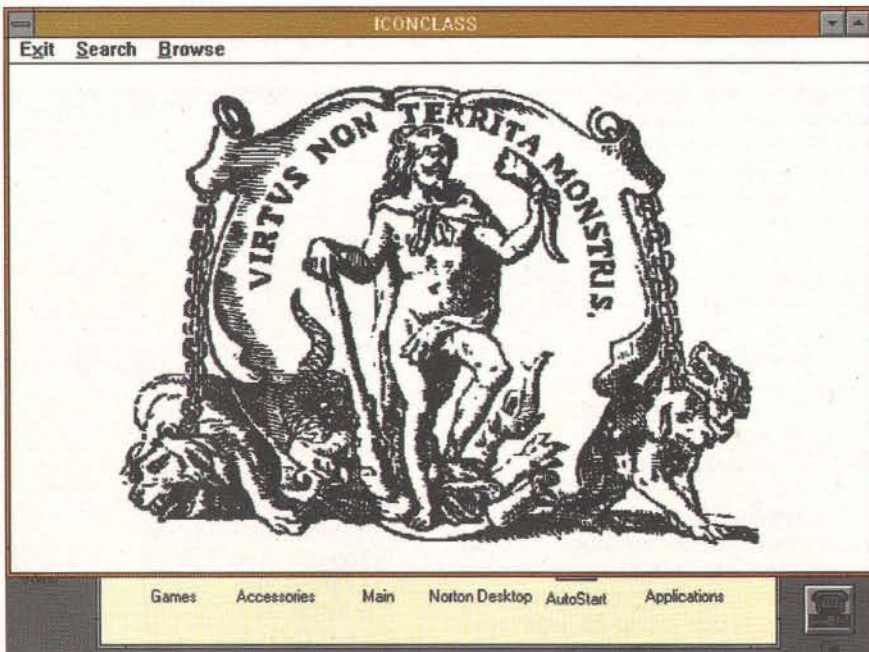

Although the Iconclass Browser might seem somewhat arcane, it sheds fascinating light on the practical difficulties involved in classifying the inherently messy structures (or, rather, the images) of the real world as opposed to the simple abstractions that we are used to dealing with in the computer industry. The problems the Iconclass developers had to tackle should find some resonance among people working on object-oriented databases or global hypertext efforts, like Ted Nelson's Xanadu project.

A Hierarchical Notation

The essence of Iconclass is a hierarchical notation with some similarities to the Dewey decimal system for classifying library books. The huge difference is that the Dewey decimal system describes only a book's title, while Iconclass describes the whole content of a picture in as much detail as you want.

An Iconclass descriptor consists of a *notation*, or a string of digits, letters, words, and other symbols (always starting with a digit), and a short description called the *textual correlate*. An example of a descriptor could be 73B59 the three wise men are warned not to return to Herod.

At the first level of Iconclass is a set of nine divisions that form the roots of nine main trees: religion and magic; nature; man in general; society, civilization, and culture; abstract ideas and concepts; history; the Bible; literature; and classical mythology and ancient history. The first five categories were designed to be general enough to encompass anything that can

Screen 1: The introductory screen of the Iconclass Browser shows a sixteenth-century printer's device.

NEWS

INTERNATIONAL FIRST IMPRESSIONS

be represented in a picture, while the last four are based more specifically on the subject matter of the largely Christian, European old masters with whom the research teams who worked on Iconclass were largely concerned.

Extensions to Iconclass can be made only with the permission of the user community.

The second level of the nature category appears as follows:

- 20 "natura" [allegorical figure or scene]
- 21 the four elements
- 22 natural phenomena
- 23 time
- 24 the heavens
- 25 earth, world as celestial body
- 26 meteorological phenomena
- 29 surrealia, surrealistic representations

You can see how Iconclass builds up its notations by suffixing a new digit or symbol on the right side for each new level of detail. As illustrated below, the notation 26C352 means "cyclone at sea" and is reached via the following path:

- 2 nature
- 26 meteorological phenomena
- 26C winds
- 26C3 storm
- 26C35 whirlwind, cyclone, hurricane, typhoon, tornado
- 26C352 cyclone at sea

At this point I must make several comments about Iconclass notations. First, no one is expected to be able to remember the hierarchy or to be able to read these notations directly; that's what the huge index volumes and the computerized browser are for. The notations are essentially arbitrary strings.

Second, the notations are not intended

to be used directly to label the pictures in a collection; they are quite unsuitable for this. Typically, researchers would use Iconclass to classify the pictures in a collection, and then curators would include the Iconclass notations as part of an actual catalog record that also encodes information such as the artist, date, and location. Iconclass can therefore be used with anything from a manual card index to a huge computer database containing digitized representations of the pictures.

Third, although Iconclass is an open and extendable system, it is not extendable by the end user. Iconclass is a shared scientific tool, so extensions to it can be made only with the permission of the entire user community, which is represented by an international review board. This usually happens after the completion of some major project that brings a lot of new material into the system. For example, it would be perfectly possible to add a new top-level category, such as

- A the Vedas
- A1 Rig-Veda
- A2 Yajur-Veda
- etc....

as a result of a large-scale Iconclass project on Indian art.

The Limits of Pure Hierarchy

The tree, or *hierarchy*, is an incredibly powerful classifying device. From the point of view of information theory, a tree reduces logarithmically the number of

(20% restocking fee on returns). All prices subject to change without notice. Please call for current prices.

Hassle-Free Printer Sharing

Now...ServerJet™ Technology for Any Printer!

You loved the features and compact size of our popular *ServerJet*, PC Magazine's "favorite solution for sharing LaserJets." But you need a solution that will work with any laser, dot matrix or other standard parallel printer.

It's called the *JetWay*™.

Stretch up to hundreds of feet of telephone-type cable from your PCs to the *JetWay*. Plug your printer cable into the *JetWay* and plug in the power cord. If you're tight for desktop work space, just slap the video cassette-sized *JetWay* onto the side of your printer.

Then, up to eight people can simultaneously *whoooooosh* documents to a printer at the "jet speed" of 115,200 baud – for less than \$69 per user.

It's that easy. Here at ASP, we call it "hassle-free." We use it as an ingredient in all of our products.

JetWay and ServerJet are trademarks of ASP Computer Products, Inc. / LaserJet is a registered trademark of Hewlett-Packard Co.

No more wandering down the hall with diskette in hand.

Or borrowing someone else's printer.

Or wasting time waiting to print.

The *JetWay* is available in a variety of models with up to 4MB of buffer memory to spool your print jobs.

Take off with a *JetWay* and watch your productivity soar!

To order your *JetWay*, or for more information about our full line of printer-sharing solutions, fax ASP at:

NEWS

FIRST IMPRESSIONS

choices you must make to find an item; thus, five or six choices might be all you need to navigate among millions of items. However, as anyone who has ever designed a hierarchical system (e.g., the directories on a hard disk) knows, the real world does not submit without a struggle to hierarchical classification; you always end up needing connections between branches (hence DOS's PATH and AP-PEND commands).

The Iconclass research teams recognized this problem and came up with several pragmatic and effective solutions. One solution is a keyword index to the whole Iconclass hierarchy so that you rarely traverse the system by starting from a root and moving downward; instead, you jump straight to the occurrences of some key concept (more on this later).

The other solutions involve the notation itself. The Iconclass notation creates a tree with up to 36-fold branching (i.e., 1 through 9, and then A to Z). However, some subtrees need far more than 36 divisions—possibly even an open-ended number (e.g., the scientific names of plants or animals). For this purpose, Iconclass includes the notion of bracketed text. In addition to digits and letters, you can add whole names in brackets to a notation. (This has the side effect of making notations more readable and contradicts my earlier comment about their essentially arbitrary nature.) A good example can be found in the Saints category. The path for Saint Alexis looks like this:

```
1 religion and magic
11 Christian religion
11H saints
11H(...) male saints [with NAME]
11H[ALEXIS]61
```

The (...) symbol in the fourth level signifies that the next level down will be subdivided by the actual names of saints. The suffixing process can continue after any bracketed names, so 11H[ALEXIS]61 means the highly specific "St. Alexis sleeping under the stairs of his father's house as beggar or pilgrim." The suffixing process can also bypass named divisions, so 25G41[ROSE]3 refers to some aspect of the rose, while 25G411 refers to the generic "nosegay, bunch of flowers."

Another Iconclass convention is that doubling a letter can modify its meaning; hence 11HH(...) means "female saints [with NAME]."

A good way to think about bracketed text is to imagine the main Iconclass hierarchy as a flat tree drawn on a blackboard.

NEWS

FIRST IMPRESSIONS

The bracketed text resembles a peg, something like a tie rack, sticking out of the board, from which you can hang any number of named parallel subtrees.

Another way to extend into this third dimension is via *keys*, which modify the meaning of a notation. The notation 25G4 means "plants," but 25G4(+2) means "parts of plants"; the (+2) is a key. The other available keys in this particular division are (+1), for "plants used symbolically," and (+3), for "characteristics of plant growth." These keys are actually defined at level 25G, but they are inherited by every notation below that level, so 25G41[ROSE](+2) means "parts of roses" and could be further qualified to describe, say, rose petals. Keys are local (i.e., they have meaning only in the subtree, which is their scope), so (+2) means something completely different in, say, 11H(..)(+2) (i.e., saints), where it means "Mary, mother of Jesus."

You may now understand my difficulty in describing Iconclass Browser: It's a retrieval system rather than a database, but it contains, in the form of bracketed text and correlates, very large amounts of data extracted from real paintings.

Yet another way of extending the hierarchy is via *structural digits*. In certain places in Iconclass, digits added to a notation have fixed meanings that form a broad "horizontal" classification, enabling you to take a cross section through a region of the hierarchy. For example, in 11H(..), all 10 structural digits are defined, including the following:

- 1 specific aspects
- 2 early life
- 3 personal devotion
- ...
- 6 martyrdom, suffering, misfortune, death of saint
- ...

Thus, 11H[ALEXIS]2 means the "early life of St. Alexis," while 11H[ANTHONY]2 means "the early life of St. Anthony." Like keys, structural digits have only localized meaning, but unlike keys, the notation does not flag the structural digits as being different from ordinary digits. As a result, you cannot tell by looking at the 2 in 11H[ALEXIS]2 that it is a structural digit.

Structural digits were added in the early, manual days of Iconclass and, powerful though they are, they are not a device that any computer database designer would have chosen, since they prevent Iconclass notations from constituting a "regular language." Hence, they make

Since 1979 mdbs has offered the most powerful family of application development tools in the world

And we still do.

Object/1[®]

Object oriented GUI development tool for both Windows and Presentation Manager applications

KnowledgeMan[®]

Relational DBMS and 4GL seamlessly integrated with decision support tools for DOS/LAN, OS/2, VMS, and Sun UNIX

3.2**

ORDER YOURS NOW!

Put more power in your PC

Plug MKS Toolkit into any DOS or OS/2 PC and you'll unleash more power and flexibility than you ever believed your hardware could handle. You'll find that MKS Toolkit is **the** essential piece of DOS or OS/2 software after the operating system itself.

Advanced programming tools once available only on UNIX™ systems are packed into MKS Toolkit for DOS or OS/2 – more than 150 of them, including utilities for:

- prototyping
- advanced command language
- command editing and history

- file processing • text manipulation
- compression • archiving • editing.

And MKS Toolkit is **easy to use**, with on-line manual pages, lots of examples and quality documentation for both novices and experienced users.

You'll be able to get the job done effortlessly too, wherever you're working. For laptop owners, our installation procedure lets you **load only the utilities you want**. For developers working on a UNIX system and a PC, we've made it **easy to copy files across systems**. And MKS Toolkit **tracks the POSIX.2 standard**, a plus for developers in open systems environments. **Networks** are perfect for MKS Toolkit too.

Plug in MKS Toolkit and soar beyond your hardware.

 **MKS Toolkit**

Price: DOS \$249, OS/2 \$349, DOS & OS/2 \$399, Upgrade \$69 (DOS only). Call for LAN and site license prices.

Circle 442 on Inquiry Card.

Screen 2: The Browser's Keyword Search dialog box can show you the path by which any selection was reached.

Screen 3: After a successful keyword search, you can browse related topics in a horizontal fashion.

You can save the clipboard's contents to a file, print it out, and add headers and comments.

A much easier way to navigate through Iconclass is by using the keyword-search mechanism. Selecting Search from the introductory window presents you with a dialog box with two entry fields. If you enter a single word in the first box, a pick list of keywords appears with the cursor possibly placed over your word; if your word is not a keyword, then the cursor will be over the nearest matching keyword the Browser can find. There is no free-form text-search facility in Iconclass; instead, the whole hierarchy is indexed using tens of thousands of keywords extracted painstakingly during the 40 years of research done by the teams of scholars who worked on the program.

When you press Return and click on Search, you get a list of all Iconclass descriptors that match your keyword, which does not mean that the descriptors have to actually contain the keyword. For example, I entered *storm*, and in addition to a lot of storms on land and sea, thunderstorms, sandstorms, and hailstorms, I retrieved a number of items such as 71G1341 *thunder and rain during the wheat harvest*<< Samuel's prayer, which does not even contain the word *storm* but is clearly semantically related (see screen 2). This is the most surprising and powerful feature of Iconclass; it acts almost like an expert system, divining your intentions in a way that a simple text search cannot.

You can refine the retrieved list by typing a second word or an Iconclass notation into the second entry field; you can use the

notation to include or exclude whole classes of items from the list. You can then press the Browse button to browse the listed items using keys, structural digits, and the clipboard (see screen 3).

Here's an example that I tried. On my study wall, I have a reproduction of *The Alchemist* by Joseph Wright of Derby, which depicts a bearded sage kneeling before a glowing retort full of phosphorus, with his wondering apprentices peering from the shadows. I tried entering *alchemist* into the Browser, and the pick list showed *alchemy* to be the nearest match. When I clicked on Search, I retrieved 49E39 *alchemy*. Browsing on this took me to

49E391 *alchemist at work*
49E392 *alchemical symbols*

Both descriptors are leaf nodes with no further "children," so I selected Options and discovered that Iconclass defines a set of keys at this point. Of these, the most relevant seemed to me to be 49E391(+6) *divulgence of the results of research*, and this is the descriptor that I added to the clipboard as an Iconclass description of my picture.

However, you don't have to stop at one descriptor. Wright of Derby painted during the Industrial Revolution, not the Middle Ages, and he was a member of the Lunar Society and a friend of James Watt, Erasmus Darwin, and other inventors/industrialists, so clearly *The Alchemist* has allegorical as well as historical significance. I searched on *personification* and noted 5 abstract ideas and concepts among the retrieval list. I then browsed

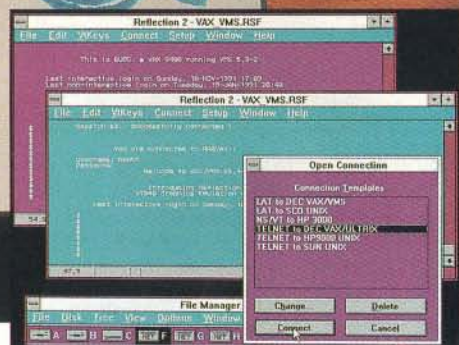

farther down and arrived at another fitting descriptor via the following path:

5 abstract ideas and concepts
52 reasoning and formation of ideas
52A intelligence and intellectual faculties
52A5 knowledge; "Cognitione," "Cognitione delle cose"(Ripa)
52A5(+1)KEY
52A5(+6) situation or event (especially in genre painting) with symbolical connotation

You can carry on this way to describe more individual objects or levels of meaning in a painting; in an actual database application, each picture might have five, 10, or more Iconclass descriptors.

Hard-nosed scientists may object that this selection process is subjective, but that is precisely the point. Art criticism and art history involve much subjective judgment, and most computer software is utterly useless in such contexts, thanks to its combination of inflexibility and bogus certitude (try running a grammar checker over a Shakespeare sonnet if you don't believe me). The Iconclass Browser, on the other hand, really does assist you in making judgments by amplifying your own hunches and guesses. This makes it a remarkable program, and a signpost to the direction in which software needs to go if we are to model the messiness and uncertainty of the real world.

Another way you can use the Browser is to identify paintings, although, of course,

Reflection: your passport to multivendor connectivity.

The computing world is changing. Now, Reflection® and the Reflection Network Series™ software extend the reach of your desktop computers in multivendor environments.

Together, Reflection and the Reflection Network Series link all your systems. Reflection provides the user interface, offering the most precise VT and HP text and graphics terminal emulators for DOS, Macintosh, and MS-Windows. Reflection also delivers fast file transfer, keyboard mapping, and a powerful command language to automate the most complex tasks.

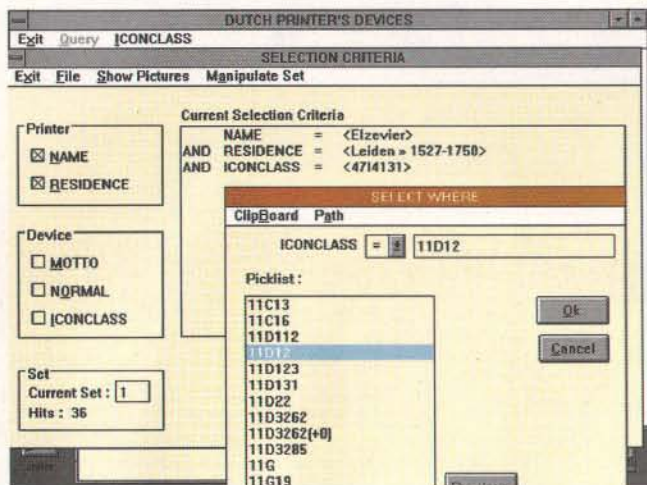

Using Reflection with the Reflection Network Series lets you work on host and server applications at the same time. Access is provided to Digital VAX, UNIX, HP, and IBM hosts *concurrently*, along with Novell and other LANs. You can run multiple protocols simultaneously on a single PC, and switch among them without rebooting. Because protocols are loaded only as needed, memory is saved as well. It's the software solution that operates without a lot of additional hardware.

Reflection and the Reflection Network Series—the connectivity choices for a changing world.

REFLECTION
SERIES
SOFTWARE

Walker Richer & Quinn, Inc.

Screen 4: The Selection Criteria dialog box for the CD-ROM database of Dutch printer's devices. Pick lists are provided so that you can set any criterion using just the mouse.

Screen 5: The end result of a CD-ROM search. If you desire, you can easily expand the picture window to the size of a full screen.

you can make a positive identification only when Iconclass is acting as the front end to an actual database of digitized pictures. Say you're looking at an unidentified old painting that features a man dressed in rags and sleeping under a staircase. A Browser search on the words *beggar* and *stair* retrieves one item: 11H [ALEXIS]61 St. Alexis sitting or sleeping under the stairs of his father's house as beggar or pilgrim. You could then assume that the man depicted is St. Alexis and begin further research.

A CD-ROM Database

The copy of Iconclass Browser that I received came with a CD-ROM containing a database of digitized Dutch sixteenth- to eighteenth-century printer's devices from the Koninklijke Bibliotheek (see screen 4). Printer's devices are small black-and-white stamps or emblems that Dutch printers and booksellers used as trademarks, and they are of great importance to antiquarian book specialists in making identifications. The user interface to this database is based on the Iconclass Browser (or, to be more exact, on the server that is the heart of the Browser).

The introduction screen of the Dutch Printers Devices retrieval program looks much like that of the Browser, except that the menu options are Exit, Query, and Iconclass. The latter puts you into Browser, and the screen contains a small box that tells you how many instances of each descriptor that you browse are actually present in the database.

You access the picture database on the

CD-ROM via the Query option. You can use a combination of Iconclass descriptors and conventional database field values as retrieval criteria in the picture database. The Query dialog box is superbly designed so that you can construct queries simply by using the mouse to pick field values from pick lists. The database fields are NAME, (city and date of) RESIDENCE, and MOTTO (the Latin mottos that accompany many printer's devices), to which you can add up to four Iconclass descriptors to limit a search.

For example, to find any printer's devices that contain an eagle motif (Iconclass notation 25F33[EAGLE]) from Leiden but not belonging to the Elzevier family, you could enter the following:

```
ICONCLASS = 25F33(EAGLE)
AND RESIDENCE = Leiden >>
1550-1850
AND NAME <> Elzevier
```

An indicator at the bottom of the window tells you how many hits this query scores, and these references get stored as a set called NR1. Further queries may create more sets (NR2, NR3, and so on), and you can then select Combine from the Manipulate Sets menu to perform AND, OR, XOR, or NOT operations between pairs of sets. You can wait to view the actual pictures until you are satisfied with your selection. Each picture appears initially as a small window in a database record card, and you can zoom them up to full screen size (see screen 5).

You can enter the Iconclass Browser at any time during query construction, and

you can import your findings using the clipboard. Even within Query, double-clicking on an Iconclass descriptor displays its full path as an explanation. Without question, this is the most enjoyable and powerful database interface I have ever encountered.

A Model for Others?

The Iconclass system is a valuable tool in its own restricted field of art history, but it can't be extended to other areas of interest. Remember, Iconclass is not a database manager or an expert-system shell; it's not an empty mold into which you can pour new and different data. The art historical data is intimately woven into the very structure of Iconclass, and it took many scholars many years to put it there.

Iconclass can, of course, be expanded to encompass other kinds of images, as the notation is open-ended. It is already being used for photographic collections, and I see no reason why it should not extend to cinema, too.

I am sure, however, that the overall method employed by Iconclass could be a model for other data-retrieval systems intended for codifying masses of real-world data. Iconclass impresses me far more than any other hypertext system I've ever used, because its "hierarchy-with-shortcuts" approach guides your browsing in a sensible way. You therefore cannot lose yourself in an unstructured and potentially inconsistent network. ■

File Transfer Under Windows 3.0

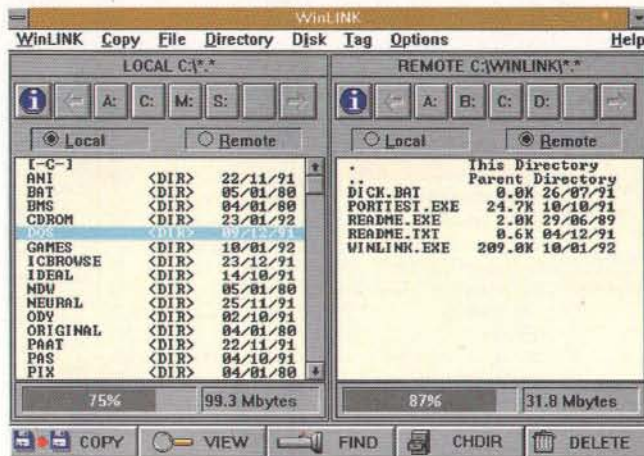

WinLink is a Windows file transfer program from East Coast Software, the Irish company that produced the excellent Trax file transfer program I tested a couple of years ago (see "PC-to-PC File Transfers Made Easy," June 1990 BYTE, International Section). In addition to letting you copy files between two IBM PCs, WinLink has a nice feature for equalizing file stores across two machines.

WinLink comes on a single disk, and to install it, you just copy the files. I tested the first release, which lacked several features, including the on-line help texts and Lap2Desk (which I'll discuss later). The company says it will automatically provide the full version to anyone who has the first release by the time this article is published.

There were three executable programs on my disk: WINLINK; WL, a DOS text-mode version of the program; and PORTTEST, a diagnostic program to help set up the system. WinLink requires a standard IBM parallel-printer cable (supplied with the software) and a special male-to-female adapter (also supplied). This is a very convenient setup, as you only need to unplug the cable at one end to use your printer. WinLink also works in serial-to-serial mode; in this mode, it can install itself, LapLink-style, onto a remote machine.

I regularly use Traveling Software's LapLink III, so my machines' ports were already connected by an old-style LapLink parallel cable. I ran PORTTEST anyway, and it announced a successful link, but only for 4-bit transfers. The standard printer cable can handle 8-bit transfers, so it lets WinLink run twice as fast.

The DOS and Windows 3.0 versions of WinLink have identical features and user interfaces, so I'll describe only

the Windows version. WinLink presents a fixed-size window with a menu bar and twin directory panes. At the top of each directory pane is a horizontal icon bar showing as many as five drives on the current machine; this bar scrolls left and right to accommodate more drives (e.g., on a network). You just click on a drive icon to list its directory.

Below the drive icons are two radio buttons that let you select local or remote operation. You can make either pane the remote machine or make both of them local (or remote) and use WinLink simply as a file manager. WinLink is better than the Windows File Manager in this role, although not quite as good as Norton Desktop for Windows.

Along the bottom of the screen are buttons labeled Copy, View, Find, ChDir, and Delete, which you use for file management operations. Copy has options to specify files by date, time, file attributes, and tagging, or by explicit include and exclude lists (with wild cards permitted).

You have full control of overwriting and prompting, and you can choose to reproduce the subdirectory structure on the target machine. You can also copy by dragging and dropping a tagged group of files from one pane to the

other. WinLink is extremely fast. It took just 6 seconds to copy 100 KB via the 4-bit LapLink cable, compared to 12 seconds for LapLink III itself.

The Find feature presents a pick list of the paths of all files that match your search pattern. You can select a path from the list and go straight to that file's directory.

On the menu bar, the Options feature lets you fix often-used copy options as defaults, and it offers the choice of a tree or a list representation for either pane. Two additional options are "Connect on start-up" and "Quit remote also." The first forces WinLink to seek a connection to the remote machine as soon as you start up the program, while the second forces WinLink to close down at both ends when you quit on the local machine.

WinLink is not a full remote-control program, so you can't execute programs on the remote machine. If you are using Windows (or Desqview) at both ends, you can just leave WinLink running as a permanent background task on both machines. I use one of my PCs as a Windows machine and the other for plain DOS; therefore, I set up WinLink to load at boot time on the Windows machine, and then I took control by running WL only when needed on the DOS machine

with "Quit remote also" turned off.

Two powerful facilities in WinLink are Update and Equalise. The Update facility copies newer versions of files, judged by the archive bit or the date and time. Equalise is like an automatic Update in both directions; it aims to ensure that only the latest version of each file is present on both machines.

Lap2Desk is a TSR utility that will be given away with WinLink (unfortunately, it was not ready at the time of this writing). Lap2Desk has no user interface; it transparently maps all the drives of the remote machine as local drives (and vice versa), so you can access all the drives, network-style, from either machine. For example, remote drives A and C might appear as drives F and G on the local machine. I look forward to seeing this program, as it is exactly what I need for my machines.

I found WinLink fast and pleasant to use, with a slick and intuitive user interface and powerful features. LapLink has real competition at last. ■

DISK COPYING

We can copy files to and from 600 disk formats including CP/M, CP/M-86, MS-DOS, PC-DOS, APPLE, SIRIUS, BBC, TORCH, APRICOT, HP-150, TRSDOS, AMSTRAD, ATARIST, MACINTOSH. Our charge is £10.00 + disk + VAT with discounts on small quantities and disks are normally despatched within 24hrs of receipt.

For more information call us.

Confidence on a program:

"I've gained a new dimension. Now, I have time to understand the needs of the users. I have been promoted to project manager."

DEFI/CREATION

The ODYSSEE's generation is born :

1.

TECHNOLOGY UNDER CONTROL.

The computer technology is still on the move. Every day gives a new concept, a new environment, a new opening. You have to face situations more and more difficult to master with regard to the choice of the technology. Find your autonomy again with regard to this technology. Don't be dependent on your background. Move to the new generation, the future belongs to computer people who will be able to work out solutions matching the user's needs.

2.

OBJECT ORIENTED.

While describing the Objects, give your developments a new dimension. No more Editor, no more Code, no more Link. Describe Data Objects, Events and Tasks. Split execution and data from functions. Use predefined actions and a language exclusively business oriented. By default, the applications will be described automatically. That's the undertaking your applications will be expanded easily through other people, and for years.

MORE THAN 1500 PAGES
ARE INCLUDED IN THE
ODYSSEE'S HANDBOOK.

3.

PROVIDING HIGH-TECHNOLOGY.

Odyssee is a High-Tech Development Tool. It's running on today's platforms released on the market: MS-DOS, UNIX, WINDOWS, NOVELL. Odyssee can access simultaneously a lot of Data Base Managers: UNIFY, ORACLE, XBASE (dBASE, Clipper, Fox Pro), DBVISTA, BTRIEVE. Odyssee can import/export LOTUS, WORDPERFECT, ASCII files. Odyssee can print on any line printer, Laser Postscript or HP. Odyssee includes his own COMPILER providing the data coherence, and will also optimize the execution speed. Odyssee can create HYPERTEXT applications, NETBIOS compatible on network, with a windowing environment.

4.

FREEDOM FOR YOUR USERS.

Whatever the requirements of your users, Odyssee will execute quickly any application, without limitations due to size or data volume. Odyssee has the expertise in taking decisions at execution time. The users will enjoy a progressive technology and won't be systematically guided while running the application. At any time, they can execute one of the tasks designed, with the full confidence that the data set will still remain consistent. At any time, the user can search through a data base, using criterions even not defined by the developer. The application will be a great hit.

Acquire, Store, and Analyze Data

Signalysys has added a unique mass-storage system for PCs to its product range. The ACP-Store package consists of a board with four analog input channels, a transputer coprocessor, 2 MB of RAM, a SCSI controller, a hard drive or a digital audiotape (DAT) drive, and software. The package lets you easily acquire, view in real time, store, and replay test and research data.

Each of the four analog input channels has its own sigma-delta A/D converter and antialiasing filter. Maximum data sampling rates are 100,000 16-bit (400,000 12-bit) samples per second per channel and are software controlled.

The ACP-Store's unique very-high-speed continuous data acquisition goes directly to its hard disk. The drives have seek times of 15 ms to ensure the maximum data transfer rate of 400,000 16-bit samples per second. Data storage capacity depends on the drive size you select, ranging from 100 MB to 1.2 gigabytes. The high acquisition rates allow continuous data storage for periods of up to 83 minutes, depending on the size of the hard drive. You get instant access to any data segment for off-line review and analysis.

The tape version incorporates a Hewlett-Packard Model HP35470 digital-data-storage-format DAT drive that achieves sustained data storage rates of 183 KBps. This would allow continuous data recording from two channels, sampled at 100,000 16-bit samples per second per channel, for 9 hours on a single 1.3-gigabyte DAT. The average access time to any data point is 20 seconds.

The ACP-Store package lets you easily acquire, view in real time, store, and replay test and research data.

Once data is recorded, you can replay it continuously and search by event, your comments, or time. The ACP-Store package lets you easily extract data for analysis. The data acquisition board becomes a coprocessor for off-line data processing via its Inmos T800 32-bit transputer, giving a potential 10 MIPS/1.5 MFLOPS of computing power for complex applications. **Price:** £5490 with a 100-MB hard drive; £6230 with a 2-gigabyte DAT drive; £7420 with a 1.2-gigabyte hard drive; £6730 with a 100-MB hard drive and a 2-gigabyte DAT drive. **Contact:** Signalysys Ltd., Buckland, Aylesbury HP22 5HU, U.K., 44-296-631306; fax 44-296-631815. **Circle 1326 on Inquiry Card.**

Adapters for Portable Computing

Tamura's SWA02W range of 20-W switch-mode AC adapters, which are available from Safety Power Group, are housed in

compact slimline enclosures, making them ideal for use in applications such as portable computing and for communications equipment such as mobile telephone battery rechargers. The units are designed to eliminate batteries in portable applications.

The adapters feature 20-W output power from a universal 90-V-to-264-V AC, 50-to-60-Hz input. Output voltages available include 9 V at 2.0A, 12 V at 1.6A, 15 V at 1.3A, and 17.5 V at 1.2A.

Enclosure dimensions are 163 by 63 by 36 mm, and the housing requires no air vents, ensuring protection from liquid and dust. The rugged housing also ensures that the power supplies can withstand everyday knocks without damage.

The SWA02W adapters have power-on LED indicators and standard International Electrotechnical Commission input connectors; this ensures that you can use them worldwide.

Price: From £20.16 to £65.75 for 100 units.

Contact: Safety Power Group, Unit 15G, Wintersells Rd., Byfleet, Surrey KT16 7LF, U.K., 44-932-336025; fax 44-932-336550.

The SWA02W range of 20-W switch-mode AC adapters are designed to eliminate batteries in portable applications.

Office Automation and Text Processing

Xios Systems says that Prisma Office, an office automation and text-processing package, meets the needs of individuals at all levels of a company. The system has three operating modes—beginner, advanced, and expert—that are differentiated by the number of functions used: 12, 36, or 84, respectively. Occasional users can therefore access the information they require from the system without having to learn complicated command sequences, while frequent users can use a greater number of functions to access Prisma Office's more intricate and powerful text-processing capabilities.

The system includes features such as communications links to E-mail, fax, telex, and mainframes; file and document management; personal organizers, calendars, and diaries; calculation and math capabilities; database and spreadsheet interfaces; a built-in relational database; and graphics integration.

Prisma Office can run on almost any hardware platform and under any of the main operating-system environments, including DOS, OS/2, SCO Unix, and AIX, either stand-alone or networked. Regardless of the hardware platform you use, you can see the same screen and follow the same command sequences. Prisma Office facilitates straightforward communication between individuals, who need to learn only one version of the software and one set of command functions to be able to use the system on any type of hardware, including notebook PCs, laptop PCs, desktop PCs, and terminals.

With Prisma Office, individuals at all levels of a company can access the information they need.

You can bring up to four documents simultaneously on the editing screen and add special dictionaries to the standard 100,000-word dictionary. The system also lets you tailor the way the program looks and operates so that you can alter its appearance as your understanding increases.

Prisma Office also lets you access external databases, spreadsheets, and graphics packages without leaving the program. The Stay-Put feature lets you pull in data from other packages without having to learn the operational intricacies of each package.

Price: £425.

Contact: Xios Systems Ltd., Xios House, Poyle 14, Newlands Dr., Colnbrook, Slough, Berkshire SL3 0DX, U.K., 44-753-680768; fax 44-753-680674.

Circle 1328 on Inquiry Card.

Professional Music Software

Amadeus Music Software says that Amadeus, its professional software package for music publishers, studios, composers, and arrangers, is the first MIDI software that can analyze music files and interpret them according to stylistic criteria. The software for the Atari MegaST4 and Atari TT can generate camera-ready copy, including titles, lyrics, phrase marks, guitar frames, and added text.

You simply specify a style (e.g., swing, rock, or classical), and the program also handles instrument selection, tempo changes, dynamics, and articulation. The system accepts input in real time or step by step from a MIDI keyboard or from the Atari keyboard.

Amadeus lets you play your music along a metronome click and store it as a MIDI file (i.e., sequencer data). The software subsequently converts the file into

a notation file with readable note names and durations to which you can add such things as articulations, dynamics, and phrase marks.

Amadeus keeps all layout information in a separate file, which lists the individual parts (or lyric parts) you want to use. The file holds information such as page size, staff size, staff distance, and accolade brackets. You can change any item without affecting the music input files (e.g., for converting a portrait-type page into landscape orientation). The program generates layouts with the aid of a template program, where you select a prototype (e.g., piano, choir, or big score) and then fill in variable items (e.g., title and composer).

You can print your music on an Atari laser printer or a PostScript printer. Amadeus lets you preview pages on-screen and use a graphical (mouse-driven) editor for final editing or for adding various marks. Drivers are available for dot-matrix printers and pen plotters.

Amadeus requires an Atari MegaST4 or Atari TT with a 20-MB hard drive. It supports the Atari SM 194 19-inch monitor, pen plotters, Atari laser printers, selected dot-matrix and ink-jet printers, and phototypesetters. The package includes a ROM module, the Idris operating system (a Unix look-alike), and 12 typesetting-quality scalable fonts.

Price: 8500 deutsche marks.

Contact: Amadeus Music Software GmbH, Rohrauerstrasse 50, D-8000 Munich 71, Germany, 49-89-785-4750; fax 49-89-785-5310.

WIZDOM – A Pioneer of the 5th Generation Software Technology

WIZDOM – A pioneer of the 5th generation of software technology.

An object-oriented application generator, currently implemented on IBM/PC (and compatibles), working under MS/DOS operating systems and any LAN system. (In the very near future we are planning to port it to Xenix/UNIX.)

An object-oriented development tool that actually emulates the human way of thinking; this unique approach is a real breakthrough in the ongoing struggle to bridge the gap between how the computer works and how we would like to express ourselves.

Easy to learn and faster to use, **WIZDOM** is everything that we can expect the '90s to produce.

With **WIZDOM**, the whole process of creating a software application is faster, easier and better.

NEWS

INTERNATIONAL

You can use the Microfax card for stand-alone and fully integrated networked fax systems.

Paperless Fax

The Microfax card for machines running under DOS and Windows 3.0 offers a paperless alternative to conventional fax machines. You can use the card for stand-alone and fully integrated networked fax systems.

In addition to a menu and window user interface, Microfax features two programmable interfaces for control of all fax functions. You can use a command language to create special transmission and reporting routines and to interface to other programs or systems. The Toolkit Interface provides direct control of the card through applications written in languages like C.

The card sends faxes automatically without interrupting other processing tasks and free of the normal fax fuzz associated with conventional machines. You can view received documents on-screen with zoom and rotation facilities and output documents to most laser, ink-jet, or dot-matrix printers.

Using the phone book database facility, Microfax

can transmit multiple copies, automatically merging address information onto cover sheets, which can also include company logos.

Automatic retry and logging of all incoming and outgoing faxes prevent errors and provide useful management and billing information. Microfax supports computer file formats such as ASCII, PostScript, HP PCL, and PCX, and the card also lets you input faxes with document scanners.

Microfax is available as a three-quarter-length card for an IBM-compatible bus or as a full-length Micro Channel architecture version. On-board hardware features the Rockwell Monofax 9600-bps half-duplex fax modem, an integral microprocessor, and RAM.
Price: £795 and up.
Contact: Comwave Ltd., 16-18 Empress Place, London SW6 1TT, U.K., 44-71-381-5888; fax 44-71-381-9210.

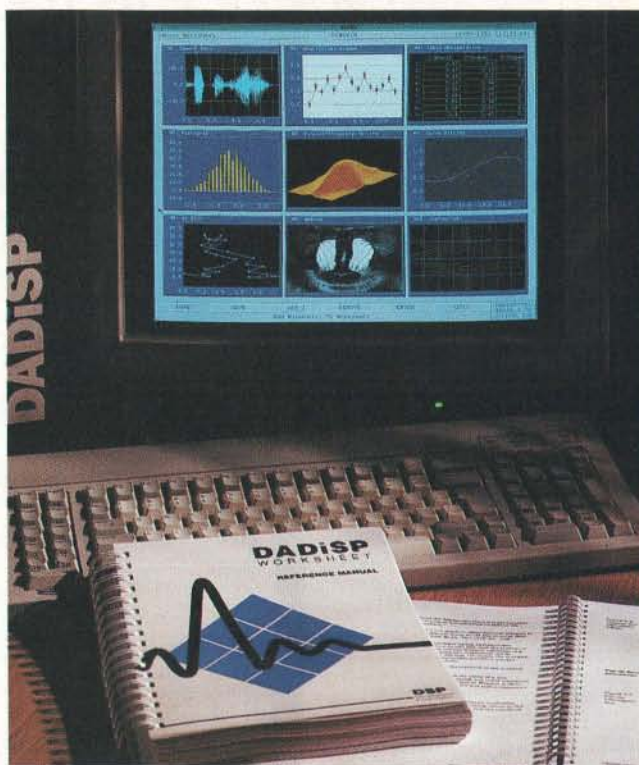

Graphical Spreadsheets

Adept Scientific Micro Systems says that Dadisp 3.0 is the first graphical, general-purpose productivity software that "speaks" the language of scientists and engineers. Designed for technical users, Dadisp provides analysis and display tools that help you manage and interpret large amounts of technical data. The software handles various signal-processing and data-analysis tasks, and it lets you view and manipulate data from various sources.

Instead of rows and columns, the Dadisp screen is a series of windows that display data in a variety of graphical and tabular formats according to your needs. When you manipulate and perform calculations on data in one window, Dadisp automatically recalculates and updates all other relevant windows.

You can create and simultaneously display dozens of windows, in which you can zoom in or out, scroll, and overlay graphs. Dadisp lets you easily perform complex functions such as statistical and mathematical analysis, data reduction, pattern recognition, peak analysis, Fourier transforms, convolutions, and

Dadisp 3.0 helps you manage and interpret large amounts of technical data.

digital filtering.

New features in version 3.0 include mouse support in both the X Window System and PC environments, extended data-analysis and statistical functions, enhanced table editing, column-structured file reading and writing, table-oriented analysis, and missing data value support. Dadisp 3.0

also incorporates the full range of standard matrix math functions, so you can store and manage data in matrix format and perform computations on these matrices.

The matrix functions and enhanced table structure let you preprocess 3-D data for later viewing as a graphical image. Dadisp's 3-D func-

tions include contour plotting, depth or height density plots, x, y, z surface plots, and spectral 3-D and 4-D plots. Version 3.0 also includes enhanced support for color and monochrome PostScript and Hewlett-Packard Graphics Language plotting, which lets you include Dadisp screens or individual windows in reports, proposals, or presentations.

In addition to these new features, Dadisp will capture data from various sources, present multiple data views, and perform a range of mathematical and graphical analysis functions. It allows textual and graphical annotation of windows and produces high-quality graphical and text output. You can run external programs within Dadisp, and only your hardware limits the amount of data and speed of processing.

Dadisp 3.0 runs under the X Window System on Sun, IBM, DEC, Hewlett-Packard, and Concurrent workstations, as well as on the IBM AT and PS/2s.

Price: £1195.

One good IDE deserves another.

IDE 1:

In the last year, over 11 million IDE hard drives have been shipped.

IDE 2:

The Mountain® FileSafe® 8500 IDE tape backup subsystem is ready to back them up.

Announcing Mountain's FileSafe 8500—the first IDE tape backup solution for IDE hard drives.

No Slot Required. The FileSafe 8500 attaches to the IDE interface already in the computer. Saves precious interface slots for other uses.

Fast. The IDE bus transfers data faster than the floppy controller. Up to 5 times faster.

Saves Time. Mountain's exclusive "Format-On-The-Fly"™ feature formats cartridges as you backup. No time is wasted preformatting tapes.

Capacity. Over 300MB of storage is possible with Mountain's TD-101 format and software data compression.

Compatibility. Fully compatible with QIC-80 and Mountain's TD-101 formats. Reads QIC-40 tapes, too!

Network Ready. The perfect match for small networks like Novell's NetWare Lite.

Backup That Works. Call 408-379-4300 (USA) or 44-276-686454 (Europe) today for a Mountain distributor and discover the total IDE solution—Mountain's FileSafe 8500.

Mountain, the Mountain Network Solutions logo and FileSafe are registered trademarks and Format-On-The-Fly is a trademark of Mountain Network Solutions, Inc. 386 and 486 EISA PCs

K yocera Electronics offers a 33-MHz 386 PC and a 33-MHz 486 PC that address both DOS and Unix environments for single-user and multiuser functionality. The Multilight 386/33 is a desktop PC targeted to small or medium-size businesses. Designed as a high-performance file server, the Multilight 486/33 has a battery-backup facility that provides supplementary power to protect the unit against sudden power surges.

Standard features of the Multilight 386/33 include 4 MB of RAM (expandable to 24 MB), 64 KB of cache memory (expandable to 128 KB), a 200-MB hard drive, four 32-bit EISA slots, a

socket for a Weitek WTL3167 coprocessor, and a Super VGA display controller on the main board that supports resolutions of up to 800 by 600 pixels. The 386/33 also comes with two serial ports, one parallel port, and one IBM AT-compatible keyboard port. Dimensions of the desktop tower unit are 124 by 388 by 380 mm.

Operating as a stand-alone PC, the Multilight 486/33 is ideally suited to running software such as CAD/CAM, memory-inten-

sive databases, or numerically intensive spreadsheets. Standard features include 8 MB of RAM (expandable to 64 MB), 128 KB of cache memory, a 100-MB IDE hard drive (expandable to 1.6 gigabytes), eight 32-bit EISA slots, a socket for a Weitek WTL4167 coprocessor, and a connector for an LCD monitor.

The 486/33 also comes with the same serial ports, parallel port, AT-compatible keyboard port, and Super VGA display controller as the 386/33. An option-

al utility box for the 486/33 provides additional bays for six quarter-height, four half-height, or two full-height memory-storage devices. Dimensions of the floor-standing tower are 180 by 480 by 625 mm.

Both machines offer DOS 4.01, dual-format floppy drives (3½-inch 1.44-MB and 5¼-inch 1.2 MB), a 102-key keyboard, and a Microsoft-compatible mouse. A 14-inch Multisync Super VGA color monitor is available for both systems.

Price: £3575 for the Multilight 386/33; £5995 for the Multilight 486/33.

Contact: Kyocera Electronics (U.K.) Ltd., 8 Beacontree Plaza, Gillette Way, Reading RG2 0BP, U.K., 44-734-311500; fax 44-734-311108.

MM-VIDEO: MULTIMEDIA FOR EVERYMAN

Affordable Video Capture for Windows and DOS

The MM-Video Board is a video overlay and capture board for PC compatible computers. View any video source on your VGA monitor - in 2 million colors - then save it to disk and manipulate the image.

Bundled Software

The MM-Video board comes bundled with 10 software programs - everything your customers need to get the most of the board's remarkable abilities - including **MM-Box**, a multimedia presentation package for non-technical users, **ToolBook System Book**, for developers to add multimedia features to applications created with Asymetrix ToolBook 1.5, and **iPhoto** to enhance images from virtually every kind of application.

\$19.95

"Power C is a heavy-weight contender - at a bantamweight price"

Stephen Davis
- PC Magazine

"On sheer audacity for price-performance ratio, we loved Mix's products"

Tim Parker - Computer Language

MIX
software

\$19.95

"The Ctrace debugger is where Mix really shines. It is magnificent."

David Weinberger
- Computer Shopper

Power C

combines a high-performance C compiler with superb documentation, at a price that brings chuckles from over 50,000 satisfied customers. That's because Power C performs favorably against compilers costing 10 times as much. And you can't buy a compiler that's more reliable or easier to use - at any price. Perhaps that's why Power C has won Computer Shopper's Best Buy award for three years running.

- compatible with ANSI C standard
- integrated Make utility
- library of over 450 functions
- IEEE software floating point
- supports 8088/286/386/486 CPU
- memory resident program support
- supports 8087/287/387 math chips
- small/medium/large memory models
- mixed model with near/far/huge
- allows arrays larger than 64K
- CGA, EGA, VGA & Hercules graphics
- 650 page manual with tutorial

\$10.00

Power C Library Source

includes our Power C assembler, plus the C and assembly language source code to over 450 functions in the Power C library. Unlike our competitors, who charge \$150.00 or more for library source code, we've made ours very affordable.

\$10.00

Power C BCD Business Math

includes binary coded decimal floating point routines and financial functions to calculate interest, depreciation, etc.. BCD routines are used for dollars and cents calculations to eliminate inaccuracies caused by rounding.

Power C requires DOS 2.0 or later, 320K memory, 720K disk space. Master C requires DOS 3.0 or later, 384K memory, hard disk.

Power Ctrace

combines state-of-the-art technology with a friendly interface, making it very easy to find and correct your programming mistakes. No time consuming edit/compile cycles are needed to track down bugs. Simply compile your program once with the trace option, and Power Ctrace does the rest. Multiple windows display your C source code, the values of all your program variables, program output, watch points, and assembly instructions. Put Power Ctrace to work for you, and we guarantee that you'll be a more productive C programmer.

Inside IBM's U.K. Scientific Centre

The second article in a series that looks behind the closed doors
of Europe's research labs

DAVID TEBBUTT

IBM has research centers scattered around the world. Some, like the ones in Yorktown Heights, New York (U.S.), and in Zurich, Switzerland, do pure research in areas such as speech recognition and single-atom manipulation. The IBM U.K. Scientific Centre (UKSC) is one step removed from this pure research, specializing in the practical application of IBM's and external R&D efforts.

UKSC's work is based on the fact that since technology is getting so inexpensive, there is no limit to the amount that can be applied toward helping people understand their applications and data. It is also based on a recognition that, until recently, the computer industry has been making money from business applications for computer specialists. The time has come to encourage new generations of users who are not interested in the computer itself but in what they can achieve with it.

In particular, UKSC specializes in the interpretation of complex data. This could be data that is easy for a human but difficult for a computer to interpret or data in such large amounts that it cannot easily be processed by a human. Accordingly, UKSC's work is focused on modeling and graphics, data visualization, image processing, image interpretation, parallel processing, speech analysis and synthesis, knowledge-based systems, and natural-language processing. The greater part of UKSC's work is done by forging links with external partners, both commercial and academic. This ensures that its projects are set in a practical context.

The permanent staff at UKSC are all computer specialists, albeit in different disciplines, while the nonpermanent staff includes industrial trainees, postdoctoral fellows, visiting scientists, and award-winning science and engineering students. The skills of these people are blended with those of professionals from partner organizations. Almost as many non-IBM

people as IBM people can be found working at UKSC at any time. This mixing of skills, plus a policy of short contracts (two to four years) for IBM personnel, keeps UKSC vital.

UKSC's partners include British Petroleum (BP), which is working on the interpretation and visualization of seismic data to assess the best methods for oil extraction from individual reservoirs. Oceanographers from Southampton University are helping to create three-dimensional visualizations of ocean currents. A major car company is assisting with new ways of capturing design information using a touchscreen and stylus. Doctors at a leading hospital are working with UKSC to create drug trials planned with the help of knowledge-based systems. And a large U.K. bank is

Photo 1: This 2-D image shows pools of warm water moving around the coast of South Africa. The brighter colors show the warm water, and the blacks and yellows show the land mass.

experimenting with a pilot office-dictation system using speech-recognition technology.

Oceanography

Syd Chapman is a computer graphics specialist who has spent three years at UKSC. He brings his computer graphics skills to bear on real-world problems introduced by organizations with whom he has formed alliances. He has worked with the four elements of the ancient alchemists: air, earth, fire, and water. Hence, his project's code name is Merlin. It pools tools and earth science information to gain a better understanding of how the world's elements interact.

Chapman has helped engineers visualize combustion processes inside engines and in simulations of oil rig disasters. He

has helped meteorologists translate their data into realistically rendered cloud formations. He's also worked on seismic interpretation, oil reservoir modeling, and the visualization of ocean currents off the tip of South Africa (see photo 1).

His aim is to help the collaborating organizations do their work better by applying computer graphics tools and techniques. In the process, UKSC learns more about the real-world application of its technologies. Chapman's extensive knowledge of the technologies available enables him to bring disparate graphical elements together to create new and more powerful visualization tools. He hopes to create what he calls "a spreadsheet for visualization," in which a user can grab and assemble slices, chunks, and planes from different data sets and assemble them into rendered 3-D models.

He has already achieved success with his visualization of the ocean currents off South Africa. One of his sources of raw information is the Fine Resolution Antarctic Model (FRAM), which runs on a Cray supercomputer. Extracts from this model are sent to UKSC, where they are visualized. Similarly, information from the National Oceanographic and Aeronautic Administration provides topographical detail. The NOAA has mapped the physical surface of the entire earth, sampling at 5 points per degree and at 1-meter vertical resolution.

The area of the sea under investigation is noted for its regions of warm water that migrate from the Indian Ocean to the Atlantic Ocean. The FRAM information describes 30 horizontal "slices" of the ocean, starting at a spacing of 3 meters and growing to 150 meters at the bottom. The plan-view animations of single slices

can be run on an IBM PS/2 Model 80 with 10 MB of memory and a 300-MB hard drive, but Chapman needed a RISC System/6000 to see the finished 3-D simulation of the area (see photo 2).

Each frame of the animation was created with a solid-modeling system developed by UKSC, called WINSOM90. Each frame took from 1 to 2 minutes to calculate, occupied 250 KB, and was displayed at approximately two frames per second in 8-bit gray scale. The 3-D animation clearly showed inverted cones, or vortices, of warm water moving around the South African land mass from one ocean to the other.

Seismology

Another practical illustration of UKSC's visualization work is its analysis and presentation of seismic data from oil fields. The work is carried out at UKSC by Dave Williams, a member of the European Visualisation Centre (known as EVISC)—a trans-European group funded by IBM Europe to provide visualization solutions to customers. For example, in the oil field work, data could be taken from different parts of a field and the common values surface-mapped. UKSC is currently working with the results of an oil field simulation performed on a Cray computer at BP Research. Each different value presents a different surface shape, making it possible to see the layout and content of an underground oil reservoir.

If, for example, water was used as an injectant to help move the oil along, it could be shown in a different color than that of the oil. The mapped surfaces can be rendered to give a realistic 3-D effect that makes the visualization easier to understand. Water is an inexpensive option as an injectant, but it has the disadvantage of sinking to the bottom of the reservoir. It can leave 30 percent to 40 percent of the oil trapped.

Carbon dioxide is an alternative injectant—with the advantage of mixing with the oil, thus rendering it less viscous and improving the flow. The disadvantage of gas is that it tends to rise and can slow production if it reaches the wellhead.

Petroleum engineers are experimenting with different mixes of gas and water to try and find the best solution for specific circumstances. The UKSC team is able to use simulation to assess the merits of different proportions and timings for the gas and water injections.

The UKSC team creates animations of the movement of oil by selecting different readings, creating a surface visualization for each, and then playing them back one after the other. The density of

BYTE ACTION SUMMARY

By combining computer designers and applications users, IBM has developed solutions in oceanography, seismology, natural-language processing, and knowledge-based systems through the development of core technologies in the areas of pen input and parallel processing.

the oil increases as you move away from the injectant and toward the production area. The team is basing its current activities on static readings but hopes to start working with time-based data soon.

A problem the team faces is identifying and accurately representing shale barriers and geological faults. Shale barriers (horizontal rock layers) make it difficult to flush out the oil that lies between them. Geological faults (when rocks slip against each other) cause oil chambers to be split into two, vertically separated on either side of the fault.

Representing these items has been difficult using the UKSC-developed WIN-VIS90 visualization tool. The normal interpolation used when surface mapping would disguise the fault and be of little help to a petroleum engineer. Data Explorer, a new visualization product developed at IBM's Yorktown Heights research center, can show all the elements (i.e., oil, carbon dioxide, water, and shale barriers) at once—a valuable improvement for petroleum engineers. UKSC runs this hardware and software product on a RISC System/6000.

Parallel Processing

UKSC has been working on parallel processing for four to five years. Through working with outside partners, it has often found itself creating new hardware and software to complete working parallel-processing systems. Some of these systems might connect a parallel-processing system to a workstation as its front end; others might be embedded parallel-processing systems for use as accelerators. UKSC's W4 multiprocessing adapter contains four 860 processors, 32 MB of memory, and a graphics screen with 1200- by 1024-pixel resolution. It gives a theoretical peak performance of approximately 240 megaflops.

Mike Platt, the person in charge of this project, points out that massively parallel teraflop machines are conceivable, which would be of great interest to a scientist or engineer who wants a lot of power at a reasonable price. They are, however, quite inappropriate for normal commercial applications, because the underpinning software simply does not exist. Platt says, "the software environment is unusable for the majority of users." He also points out that, compared with the speed at which hardware developments are moving, users move very slowly indeed. They prefer to wait until a familiar-looking infrastructure emerges to cocoon them from the harsh realities of parallel-processing systems.

Platt can see applications for parallel

Photo 2: In three dimensions, the warm water eddies are revealed to actually be cones of water moving from the Indian Ocean to the Atlantic Ocean. (Note that the vertical scale has been significantly exaggerated in this image.)

architectures in visualization servers. The tasks can easily be split up into pieces. At the very least, the manipulation of a database and the creation of a visualization can be handled separately. Edinburgh University is working with UKSC on connecting a Caplin Cybernetics parallel-processing system to an IBM RISC System/6000 workstation to analyze and model Shell U.K.'s oil-reservoir data. It's easy to see potential uses of parallel-processing database, graphics, mathematics, engineering, and scientific applications; it's more difficult to see uses in the general commercial area.

Ideally, applications shouldn't need to know whether they are running on serial or parallel machines. For this to happen, operating systems must make the underlying hardware invisible to an application. UKSC is working with Southampton University and Open Software Foundation on an operating system that will run on both parallel and serial machines. IBM's Palo Alto Research Center in California is working on a multiprocessing version of AIX, called AIX/860.

Other Projects

Pharmaceutical companies and hospitals run exhaustive clinical trials that use much nonmedical skill to set up. In collaboration with the Brompton Hospital, the North Staffordshire Hospital Centre, and the Imperial Cancer Research Fund Laboratories, UKSC has been creating a knowledge-based system to help junior doctors build these trials. UKSC created the checking system for the trial designs using TIRS, a rule-based shell that compiles into C. The team is working on more flexible ways to input requirements, especially with the use of Small-talk-style sliders to set numerical values.

Chris Paradine, the person responsible for the Designer Workstation, another UKSC project, acknowledges that

there are a lot of good CAD products. He points out that there is very little, though, for the casual designer who doesn't want to be a computer expert.

Paradine has been working on ways to help users with drawing skills make the most of these skills. He works on what he calls "the least astonishment rules." His equipment is a touch-sensitive display screen, a mouse, and a stylus. He uses the mouse to rotate a drawing, and the stylus to draw prototyping lines. Once a new arc is drawn in two dimensions, you can see the effect by rotating the drawing in three dimensions. The result of this modelless approach is a wireframe illustration that can be easily altered.

The key to the success of IBM's UKSC lies in its relationships with the outside world and its short-term staff contracts. It is close to the Hursley Park Development Laboratory, so there is never any shortage of talent. In fact, UKSC is a coveted posting for IBM staff members. The IBM people bring their knowledge of computer systems to UKSC projects, while outsiders bring their knowledge of other disciplines and an enthusiasm for applying computers without being aware of their limitations. In such an environment, new ideas with practical applications stand a good chance of survival. ■

Editor's note: This is the second in a series of occasional features that look behind the doors of Europe's R&D laboratories. The first article examined the innovative developments going on at DEC and Olivetti's joint research lab in Cambridge, U.K. (See "Inside Pandora's Box," November 1991 BYTE, International Section.)

David Tebbutt is a journalist based in London. He is also the creator of Brainstorm, an ideas processor for the PC. You can reach him on BIX c/o "editors."

THE SMART KEYBOARD
REPLACEMENT.

NO ONE BRINGS
OUT THE GENIUS
IN YOU LIKE
WE DO.

If you put a little Genius into your computer there's no end to what you can do.

Genius *HiPen* transforms your old keyboard-based PC into a powerful pen-based system. Your handwriting will be instantly converted into type. With pad and pen. Just the way you've always worked. But with a totally new dimension of productivity.

For ultimate desktop freedom, we've created a mouse with no tail – the *HiMouse Cordless*. Its infrared beam will keep your PC in line. From up to 6 feet away.

With our new *HiScan* hand-held scanners, you get more hot Genius features than ever before. And intelligent software muscle you won't find anywhere else. Like precise optical character recognition and professional image processing software. So now your images and text will come out even more brilliantly than when they went in.

But without smarter input, how could anyone expect genius output?

INTELLIGENT INPUT FOR
BRILLIANT OUTPUT.

SequeLink: the universal client/server solution, guaranteeing you full freedom of choice

DYN De Visscher & Van Nieuwen

SequeLink : the efficient client/server solution

SequeLink is a transparent client/server software which optimises the interaction between your client-workstations, servers, RDBMSes, networks and applications. It bridges every standard you have already chosen, while giving you a free choice of the range of hardware and software you may want to use in the future.

Thus, you increase the return on your computing investment.

The assets of SequeLink : advance and independence

Since its introduction three years ago, the developers of SequeLink have gathered more experience than anyone else in the design and

implementation of client/server software in a truly multi-vendor environment.

Being a product of GnOsIs, an independent software developer, SequeLink does not discriminate against any particular application, platform, RDBMS or network. It supports all of these components equally efficiently and regardless of brand. This is why SequeLink is so powerful.

Hundreds of large and medium-sized corporations in the U.S., Europe and Japan are already satisfied users. Choosing SequeLink is opting for a proven and efficient client/server solution.

Client/Server Middle Ware™
SequeLink™

Just tell us about your environment. We will send you a customized solution.

Windows 3!

Yes, it's here! LPA 386-PROLOG is now available in a version for Windows! Just like the DOS-extender version, it is a genuine 32-bit Prolog compiler which can directly access up to 4G (4096M) of memory. Only this time, it is fully integrated with the world's most popular GUI: Windows 3!

A MESSAGE TO OUR SUBSCRIBERS

FROM TIME TO TIME WE MAKE THE BYTE SUBSCRIBER LIST available to other companies who wish to send our subscribers material about their products. We take great care to screen these companies, choosing only those who are reputable, and whose products, services or information we feel would be of interest to you. Direct mail is an efficient medium for presenting the latest personal computer goods and services to our subscribers.

Many BYTE subscribers appreciate this controlled use of our mailing list, and look forward to finding information of interest to them in the mail. Used are our subscribers' names and addresses only (no other information we may have is ever given).

While we believe the distribution of this information is of benefit to our subscribers, we firmly respect the wishes of any subscriber who does not want to receive such promotional literature. Should you wish to restrict the use of your name, simply send your request to the following address.

We've got the power behind the play

Symbol of Tradition

The Chinese hand puppet Bu Dai Hsi has been a symbol of tradition, as well as entertainment, for centuries. Talented performers use these beautiful puppets to act out legendary tales, but they are only one part of this intricate art form. Behind the scenes are set designers, historians, sound effects and skilled craftsmen that handmake every puppet. Only with the power of their combined talents and dedication has the Bu Dai Hsi performance thrived for hundreds of years.

Tradition of Excellence

Inspired by traditions of excellence like Bu Dai Hsi, AGC developed the Powerplay line of computers to give you the highest quality and most versatile systems available. Versatility means you can match any 286, 386SX, 386, 386DX, 486SX, 486, 486DX, P24 CPU with any Tower, Semi-Tower, Mini-Desktop, Desktop, Slim-Desktop case to give you a system perfectly tailored to your computer needs. But like the Bu Dai Hsi performance, the Powerplay line represents only a small part of AGC's total service. Years of advanced R&D, uncompromising quality control, and experienced technical support unite to guarantee you the best show in town. Powerplay gives you the power to play.

POWERPLAY SERIES™

486 ISA/EISA File Server Faster Than AST / Everex

**UNIX/Novell/Peak/OS/2
Fully Compatible**

Model 9000

- 80486 ISA/EISA 25/33/50Mhz
- System memory up to 64MB
- 64K/256K write-back cache
- Shadow RAM on Video & BIOS
- Burst Mode Design
- Enhanced VGA Res.1280x1024 or S3 (P86C911) Windows Accelerator -option
- SCSI controller - option
- 9 half height drive bays
- Dual Fans & Wheels
- Dust cover filter
- 250W or 300W Power Supply (UL/CSA/TUV/VDE approval)
- Built-In UPS Power Supply - option
- Double Security Locks
- Power Meter: 15.2 MIPS(486/33MHz)

How do you translate great ideas into working prototypes, **FAST**?

Object Editor

Lay out the objects in the display.

Logic Editor

Point & click the functionality and behavior.

Prototyper

Try it out long before production.

only **RAPID** does it all!

The fastest way to see what you think and show how it works.

RAPID goes far beyond CAD. It lets **embedded system designers** prototype the entire interface, both **Look and Use** by simply pointing and clicking. RAPID's smart, built-in Logic Checker tests the logic as it is defined. Its true Object-Oriented principles allow designers to build and reuse graphic and logic elements **without programming**.

RAPID fully simulates interactive embedded systems, precisely as they would operate in reality. Ideas can be

interactively tested, modified and validated long before production. Automatically updated specifications are ready for reporting at any time.

RAPID is the first product to bring embedded-system interface prototyping to the **desktop**. Its open system approach lets RAPID communicate with other applications. RAPID runs under MS-Windows 3.X.

Rapid DO IT. TRY IT. FIX IT. FAST!

For those who appreciate the art

of Creating Computer Programs

You need a "special kind" of programming environment that lets you exert your most artistic thoughts into your application.

You want an "all-in-one" programming environment — with all the tools you need — for creating high-quality, feature-rich applications.

You expect a "fast and powerful" programming environment that performs with instant results — so you can create a "masterpiece" that will endure the test of time.

You deserve the Clarion Professional Developer.

The Clarion Professional Developer redefines the way that you develop PC application programs.

It puts you in full control of your application — opening up new, creative potential for the programming artisan.

Professional Developer is a fully-equipped development environment. With 14 dynamic utilities and the rich, comprehensive Clarion language — it gives you all the tools you need to design, develop, debug, and deliver complete, expressive applications.

Professional Developer is fast — it lets you turn your ideas into applications in much less time. A fraction of the time than the old-fashioned way of programming.

And with Professional Developer, your applications stand the test of time. You can create new or modify existing applications, as quickly and frequently as your application needs change.

Never again will too little time or limited tools restrict you from creating the kinds of applications you dream of. With Clarion Professional Developer this never happens...you're just a few seconds away from capturing the true art of application development.

Hardlock E-Y-E[®] - tying the hands of software pirates

The effective way to protect your software

FAST Electronic has made life a lot harder for software pirates. Hardlock E-Y-E was designed using cryptographic principles. It took the experience and know-how of Germany's number one in software protection and the leading edge technology of a US semiconductor company to create the ultimate software protection tool.

The technology programmers have at their fingertips

Hardlock E-Y-E is based on a custom chip and combines all the features that a programmer would expect from such a device: secure, algorithmic query routines and an optional non-volatile memory for custom configurations. With the Crypto-Programmer card from FAST you can program the algorithmic parameters and the memory within seconds. This unique card guarantees that no one else can burn Hardlock E-Y-Es with your codes. Linking Hardlock E-Y-E to your software is easy: you can either protect your .COM and .EXE files with the automatic encryption software HL-Crypt or integrate FAST's high level language routines into your source code.

Readily acceptable to your customers

Hardlock E-Y-E allows unlimited backup copies of the master floppy. The customer gets the device together with the software and plugs it into the parallel port between the printer and the PC. Daisy-chainability, outstanding reliability and the compact high tech design guarantee that your customers will accept Hardlock E-Y-E.

The benefits your management will appreciate

Hardlock E-Y-E can be programmed by the software house with the Crypto-Programmer card. This ensures optimum delivery schedules and stock flexibility. Revenues will go up as software piracy and multiple usage are prevented.

Hardlock E-Y-E
programmable, algorithmic response
and memory option - all in one

CLTools 3.0

Supply your Clipper program with a Windows-like user interface, extensive graphics library included:

- full mouse support for all interactive functions
- movable and resizable windows on text and graphics video mode
- scrollbars, size box, close box, pull down menus, icon menus
- about every graphic element you can think of, image-management, presentation graphics
- perfect graphic printing results free of distortion, PCX support for scanned pictures
- interactive graphic input input with rubber banding, vector font

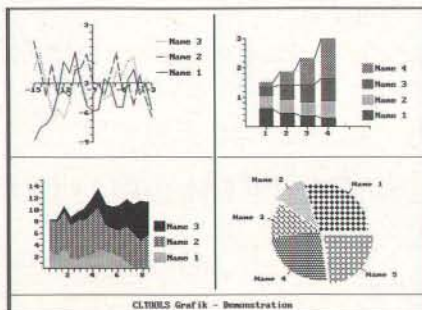

Whether you need operating system functions, access to the printer spooler etc. - CLTools implements all the functions your program needs including sophisticated serial interface functions, interrupt driven timers etc..

\$ 490

CLReport 3.0

The high performance report generator with easy-to-use WYSIWYG user interface offers fast database-query and versatile design options. The runtime module (linked to the application) manages complex field-, line- and group expressions, having access to all functions and variables of your program. The fast report output supports more than 350 different printer types, graphic fields and page preview. With CLReport you can forget all about difficulties with external programs, laborious function control or licensing agreements.

\$ 310

Professional

CLText 3.1

Powerful word processing including formatting options, hyphenation, block commands, printing attributes, mail merge etc.. The text to be edited can be processed as a string, as a MEMO field or as a file. Thanks to Virtual Memory there is no limit to the text length. You are able to program your object-oriented word processing - as many editor-objects as you want with more than 100 methods - to suit your personal needs. A complete application with source - MS-word-like in look and feel - is included as well as a printer-file with more than 350 printer-installations.

PROGRAMMERS, HERE IT IS: CLIPWORD

At last the demanding programmer can develop applications that feature complete text editing facilities. Through a series of powerful functions, CLIPWORD provides extensive text design capability in memo fields or other text.

Style your text: **Bold**, *italic*, large, small, wide or underlined, CLIPWORD leaves it all up to you. Automatic wordwrap and justification as well as an extensive number of block functions are matter of course. You can set left or right justification or centering of text. Function keys can be defined freely enabling the same user interface as Word, Wordperfect or other word-processing systems. CLIPWORD offers mailmerging facilities that pull in database field information enabling mailshots and individual letters to be produced.

A wide range of printers and printing to a disk file is supported. Users can create a Dos shell, read and write text files and use the built-in backup routine. CLIPWORD is fully network compatible. CLIPWORD may be dynamically overlayed with Blinker and RTLink. A complete Norton-Guide manual is provided with comprehensive examples.

IT IS BEYOND WORDS EXCELLENT!

Available for Clipper 5.x, MS C, Quick C, Turbo C, C++ and Quick Basic.

Graphics Produced on Wavefront Software.

When strategy is your business, you need the facts at your fingertips . . .

Workstations and Desktop Software & Solutions — two new services from Datapro International

When your task is to frame your company's strategy, you need the facts. But in the business of computing, time is short.

Datapro recognises this and provides fast accurate information.

Our two new information services, **Workstations**, one volume, and **Desktop Software & Solutions**, two volumes, give you exactly what you need to make business decisions.

Workstations describes and evaluates every major computer product and its place in this dynamic sector of the world-wide marketplace, while **Desktop Software & Solutions** surveys the software options that are crucial to building an integrated information strategy.

Only when you have this knowledge can you assess your own position and decide how to commit your resources.

Datapro International takes the guesswork out of strategic analysis by giving you the world-wide picture, quickly, reliably, consistently and updated monthly — so your information is always current. Ensuring that you minimize your risk and maximize your advantage when you make decisions about your company's future.

When your business is strategy, nothing else will do.

Published by Datapro International, a division of McGraw-Hill, these services are currently being offered to new subscribers for a **15 DAY FREE EVALUATION PERIOD.**

For your free evaluation, or to find out more, simply fill in the coupon opposite.

USER'S CHOICE AWARDS

It's that time again. Unlike some people, I don't give my annual awards until the end of the year, which means it is now time for the 1991 User's Choice Awards and the Chaos Manor Orchid and Onion Parade.

Two cheers for IBM for not releasing OS/2 2.0 in 1991. They advertised that it will be a better DOS than DOS and a better Windows than Windows, and no matter that it's been coming Real Soon Now for quite a while, they're not going to ship it until it works properly. I can agree with that decision.

Two cheers for Bill Gates for delaying the release of Windows 3.1 and announcing Windows NT (New Technology) years before it will ship. Meanwhile, out here in User Land, we'd just like something stable that works and won't give us unrecoverable applications errors....

Three cheers and an orchid for AMD and their 386 chip, which has sent the prices of 386 systems tumbling, and for developing a 40-MHz 386 chip. Two cheers to the Taiwanese clone makers who advertise systems as "Intel Inside" and then in small print tell us they're using AMD chips....

User's Choice

I began the annual User's Choice Awards on a whim. This was long before everyone else began giving awards. It was also during the early days in the computer industry, when there weren't many products that *deserved* awards. I conceived it as part of my job to drive the computer industry in directions I thought would be best for users. The awards, as well as the onions and orchids, were designed to further that end, and they've had some success.

The trouble is that I began with the wrong approach, because I wanted to give awards for "the best of the year." That wasn't bad in the early days, when I really could look at most of the major items in any given category, but now it's often plain ridiculous to pretend that I have looked at everything significant. Worse, though, is how do I choose when several products are more than good enough?

Sometimes, though, a product will stand out so much that there's little doubt, and I have no hesitation in calling it the top product in its field. When that happens, I'll say so. But do understand that just because some product stands out alone doesn't mean that it's "better" in some absolute sense than another wonderful product that has to share the glory with a competitor. Good enough is good enough, and that's how User's Choice Awards should

be taken. By designating a product as User's Choice, I'm saying that if you need its capability, you won't be sorry you bought it.

The rules here are simple: I don't recommend anything I have not personally used long enough to have confidence in. I discuss these decisions with my BYTE editorial colleagues, and BYTE helps distribute the certificates, but the User's Choice Awards remain my sole responsibility. Blame me, not BYTE....

Upgrading Your System

Probably the best upgrade you can buy for your DOS system is a caching drive controller. Caching is a means of anticipating what data your computer will want next and putting that data where the machine can find it fast. For example, all caching systems keep the disk directory and file allocation table in cache memory so that the computer doesn't have to physically access the disk to find out where to get or store a file. After that the caching programs vary, although all of them use some kind of "most used, last discarded" algorithm.

One way to get the benefit of caching is to add more memory and use one of the better software caching programs (e.g., Vcache from Golden Bow Systems or even the SMARTDRV.SYS that comes with Windows). However, those programs just add to the work load of your CPU and bus, and they tie up memory you could be using for other things.

By contrast, caching controllers have an on-board CPU, so you're doing true multiprocessing. They have algorithms at least as good as the software-only caching programs and caching memory on the controller card. The result is a dramatic improvement in performance: reads and writes go much quicker than under straight DOS or DOS with a software cache, and you still have all your expanded memory. Moreover, you can save system memory. I have not been able to see any difference

The annual Orchid and Onion Parade at Chaos Manor

in performance with or without buffers, which wasn't true prior to my getting a caching controller.

I have used two caching controllers. The first one I got is from Distributed Processing Technology, the PM2011/90 for SCSI hard drives. (I also have their PM3011/70 for ESDI hard drives.) The other one is the HyperStore 1600 from Perceptive Solutions, Inc. They both work splendidly. I have to work hard to devise tests that will show any performance ad-

vantage to either one. One test I have is a big matrix inversion that repeatedly stores intermediate results on the hard disk. Caching controllers typically save about 50 percent of the 5 minutes the program requires when running with a noncache controller, and the difference in time for the controllers from DPT and PSI is negligible.

Both these controllers are easily installed. Each company has SCSI and ESDI controllers. PSI has configuration modules for other types of drives, so if you

have such a drive, your choice is clear. Otherwise, you simply have to go on brand loyalty and price.

Moreover, both PSI and DPT controllers have modes to let you use just about any old drive you have available. PSI has a way to add on several different *kinds* of physical drives and run them all at once through add-on modules known as *media adapters*. This could be useful if you have, say, a SCSI drive and an IDE drive and want to use both in the same machine. Both PSI and DPT controllers have ways of making your machine believe you have an AT-compatible hard drive, no matter what it really is; they will also let you use the latest and greatest hard drives and software. Both companies have excellent technical support. Although it isn't needed for simple installations, it can be important as soon as things get tricky.

I've been writing about both companies for three years, and I have received no reader complaints against either. DPT is a bigger company and has been around longer. Their products cost more, and they use proprietary memory cards. PSI has been steadily gaining market share in the last two years and has been around long enough that I'm sure they'll be here for a while. PSI charges less and uses standard SIMMs for memory.

In a word, both companies are plenty good enough. I am pleased to award DPT and PSI User's Choice Awards for 1991 for their caching controllers.

Video Boards

Windows with old and slow video is nearly intolerable. If you want to switch to Windows, it's imperative that you get a fast video board. The improvements are dramatic. Our friend Steve Allen Mitchell, a Unix workstation guru, has to work with Windows off and on. He was recently introduced to a 486 with an ATI Technologies Graphics Ultra video board and said, "That's as close to a workstation as a PC is going to get."

Unfortunately, pure speed is not enough: there are boards out there that are plenty fast enough, but whose BIOS hogs memory the board doesn't really need. It's important to get a board that works properly with Windows, yet allows you to use good memory managers; and it's important to get that board from a company that understands driver software.

I have had half a dozen video-board companies recommended to me. I'm sure they're all good, but I can recommend only what I use myself. Do understand, I have tested these only under Windows, not under the X Window System or Unix.

For Windows, the two video boards and

Move to Windows, stay with the VAX.TM

Considering Windows? But can't afford to lose contact with your host? KEAterm 420 is the solution: DEC VT420 terminal emulation software for Windows 3. Now, you can have the best of both worlds!

KEAterm 420 is a true Windows 3 application which provides the functionality of DEC's VT420, VT320 and VT220 terminals in a window. KEAterm 420 version 2 gives you the features that count: multiple pages, multiple sessions, file transfer, multilingual support (English, French and German), script language and DDE support as well as network connections. Using the familiar Windows interface, KEAterm makes it easy to move between servers, hosts and PC applications. With KEAterm, you can do it easier, do it faster, do it better!

To tie it all together, use KEA's network connection

software: KEALink LAT, KEALink TCP/IP, and KEALink IPX for concurrently connecting to your Novell network and your VAX or UNIX host. To eliminate keyboard remapping, select KEA's *PowerStation* VT layout keyboard to plug into your PC. And if you're a DOS or UNIX user, KEA Systems offers the ZSTEM family of VT graphics and text emulation software for desktops running DOS or UNIX.

For superior PC-VAX-UNIX connectivity, call today!

MINUTEMAN PLUGS IN WORLDWIDE.

Now get total power protection from MINUTEMAN anywhere in the world. MINUTEMAN takes charge worldwide with instant protection when you need it most.

Every day your company relies on its voice and data communications equipment to stay productive. Unfortunately, the electricity that powers these vital systems is not reliable.

Blackouts, brownouts, spikes, surges and even lightning strikes are common. And the high cost of losing vital information and productivity due to power outages and

surges calls for preventive measures.

But power requirements can be confusing. And your company has unique needs that often require custom solutions.

MINUTEMAN offers the most comprehensive line

of UPS systems available, protecting all your business equipment from stand-alone workstations to the largest of the IBM AS/400s.

MINUTEMAN products are sold and serviced worldwide. Call on our skilled professionals to help you determine your exact power protection needs.

MINUTEMAN PRODUCTS

- On-line and standby UPS
- Shutdown software for every available operating system
- 300VA to 10KVA
- TUV approval
- Now in over 100 countries
- Regional service centers
- Automatic voltage regulators
- All international voltages

Contact our Power Professionals on the POWER FAXLINE below, or call (214) 446-7363 for your free Power Protection Guide.

MINUTEMAN®
UNINTERRUPTIBLE POWER SUPPLIES

**SEE US AT
COMDEX SPRING BOOTH 185**

Circle 100 on Inquiry Card.

Our MINUTEMAN Global Socket (GS) Series uninterruptible power supplies accommodate the unique needs of our international customers. You no longer

need to use adaptors or cut and splice on a new plug. Our GS UPS systems are universal and compatible with all major

plug patterns.

Our UPS systems are ready for both the individual computer and for your network. These popular MINUTEMAN UPS systems

employ our advanced technology to create the most dependable UPS available.

By integrating the latest MOSFET technology requiring fewer components, each GS Series

model is more compact.

The result is a truly advanced and economical UPS for all your business needs, worldwide.

Global Socket UPS systems are universal and compatible with these plug patterns.

- British (standard)
- European (Europlug)
- Australian
- Italian
- French

APPROVED**

video software that I currently recommend are from ATI and Sota Technology. Both boards are easy to install, the physical board and software drivers. The documents are complete and easily understood, and technical support is good. I'm pleased to give the ATI Graphics Ultra and the Sota Lightning VGA my 1991 User's Choice Awards.

Printers

For many years, we have had one of the very first Hewlett-Packard LaserJet printers ever made. It was eventually refurbished as a LaserJet Plus and became The Printer That Would Not Die. Over the years, I came to dislike certain features, particularly the fact that it stacked the paper face-up, meaning that a book came out with its pages in the wrong order. It was also difficult to insert letterhead. It wasn't particularly fast, although compared to the Diablo daisy-wheel printer it replaced, it certainly was.

All that was mere grouching, though; that printer was wonderful. It worked year after year—never in the shop, never out of service, always there when I needed it. I turned out thousands of letters and a dozen

or more books on that printer.

It still works and is in use at a church school. But this year I replaced it with a LaserJet III, and once again I'm in love. If you need a real workhorse printer, one good enough for most office work, the LaserJet III is more than just good enough; it's outstanding. It's easily installed. There are dozens of fonts for it (it uses all the font cartridges from my old LaserJet I), and nearly every software package provides drivers for it. It's fast, it's designed so that it's easy to insert letterhead or print envelopes, and it's very reliable.

I have no hesitation in giving the LaserJet III a User's Choice Award as the most useful printer of 1991.

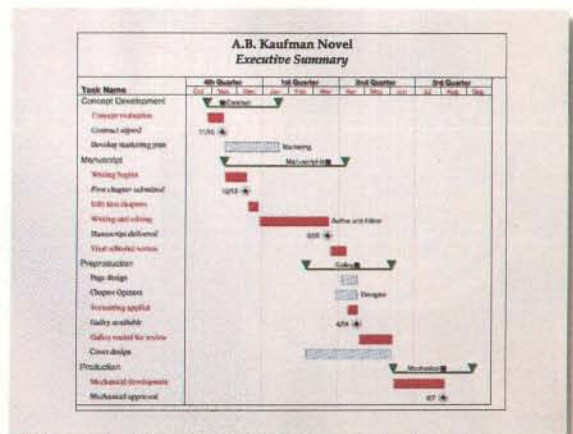

The LaserJet III does have resolution limits, although they aren't severe. As I detailed in a previous column, Jim Baen was able to do the final typesetting of *Go Tell the Spartans* by Pournelle and Stirling using the Baskerville typeface, Ventura Publisher, and a LaserJet III to produce masters that were then photoreduced to make the printing plates. However, that book was an all-text paperback printed on typical paperback paper; this process would not have been good enough to do

the typeset masters of a larger-format book on slick paper.

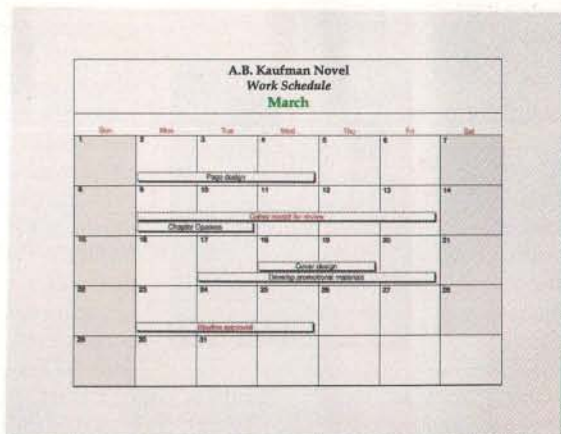

For that kind of resolution, I recommend the LaserMaster TrueTech 1000. This produces 1000-dot-per-inch resolution output with well-shaped letters. The LaserMaster algorithms for increasing printer resolution appear to be better than HP's trick for accomplishing that. Indeed, I see no reason why LaserMaster output couldn't be used to master any book I have, regardless of size, typeface, and paper stock. Let me hasten to add that I don't pretend to be the final authority on typesetting, and if you're contemplating doing high-resolution print masters, you probably want to spend some time researching the situation.

I do know that the LaserMaster TrueTech 1000 produces aesthetically pleasing copy. Moreover, unlike the phototypesetter it can often replace, the LaserMaster doesn't require nasty chemicals, and, also unlike most phototypesetters, it's extremely reliable. If you need high resolution, you'll be happy with the LaserMaster TrueTech 1000. It gets a User's Choice Award in the Very High Resolution Printer category.

The CEO wants to know when it will be finished.

The staff wants to know when they can start.

As a project manager, you've seen it all before. Everyone who needs to know, all too often, needs to know something different. Which is why there's new Microsoft Project version 3.0 for Windows.

It not only makes it easy to present

things the way *they* want, but also lets you plan things the way *you* want.

Now you can enter and view data in a variety of ways—Gantt, tables, graphs, forms and more. Microsoft Project also has a customizable Toolbar, giving you access

File Conversions

There's always a need to convert files from one format to another. It's especially true when changing over to Windows, but since I use Q&A Write, hardly a week goes by when I don't get a file in a format different from that of my word processor. When that happens, I rely on Word for Word from Mastersoft to convert the file, and that usually works.

I say *usually* for accuracy; I'm not trying to be hard on Word for Word. The problem is that there are a lot of file formats out there, and some of them use some obscure tricks. It would be surprising if everything worked the first time every time. I've used a lot of file-conversion programs, and the one that has worked consistently best has been Word for Word; moreover, they keep updating it, and each revision is an improvement.

I'm not 100 percent satisfied with the program: I wish there were better "intelligent ASCII" conversions for use on files pulled off-line, and once in a while I get some odd glitches when converting to Q&A Write format. But it's still the best conversion program I know, plenty good enough to win a User's Choice Award.

Windows vs. Desqview

I can't decide. I have used Desqview for years, and I'm comfortable with it. Desqview with a 386 machine is so superior to DOS that until Windows 3.0, I couldn't imagine using anything else—and it's indispensable for 286 systems. It's true that you have to fuss a bit with Desqview, but even that's much simpler now that Quarterdeck has revamped the installation program. Desqview works and works well, and I'm used to it, so I can jump from word processor to notebook to telephone book to diary to communications program simply and easily, and I generally have no problems at all.

Alas, it's not *fun*, while Windows is. I confess it: I like being able to customize my start-up screen. I like wallpaper, and flying toasters are fun, and so is having a Gary Larson Far Side cartoon come up with my calendar page on start-up. I like having silly little customized icons. I can even offer the intellectual defense that seeing all those icons on my computer desktop reminds me that they're there, just as having books all around me in my office reminds me of things I read long ago. Then, too, there really are some Windows

programs that are so good that it may be worth buying Windows to be able to run them. I'll get to those in a minute. The point is, there's a lot to like about Windows.

Alas, there are a couple of things to hate, too. The one I hate most is that Windows is far more likely to crash than Desqview, and when it does, it's likely to crash utterly and completely, requiring a hardware reset and certainly losing any unsaved work.

In fairness, I have to say that I never install and try a new application in either Windows or Desqview without saving everything first, so the amount of work I have actually lost due to Windows crashes is small to nonexistent. Also, the time lost to having to go through hardware reset is probably made up by the fact that it's generally faster and easier to install a DOS program under Windows than to get it right on Desqview. I also have to say that Desqview used to crash fairly often, and I stuck with it, and I'm not sorry.

The programs that crash Windows have generally been games. Some of them, like Strategic Studies Group's Warlords, will run under Desqview but crash Windows.

USER'S COLUMN

But I have to confess that I seldom play games under either Windows or Desqview, so the problem would seem more theoretical than real—but the theoretical problem is that if that game will crash Windows, what else will? And once in a while I get some very mysterious glitches, but I'm pretty sure they're specific to the Windows 3.1 update and will be fixed before you read this.

Alex points out that you can run Windows under Desqview; that way, you run all the DOS applications as Desqview applications and all the Windows applications in Windows. What you get that way is standard-mode Windows, but the practical effect of what enhanced mode really does is memory-address checking, and the combination of QEMM and Desqview does that better and faster anyway. Even so, it feels like a kludge, and I'd rather not have to run two different environments, particularly when I'm testing new software.

The gripping hand, as Moties are wont to say, is that if Windows hasn't quite become good enough, it won't be long before it gets there. While I will keep Desqview and use it when necessary, I expect the switch to Windows to be done by the end of this year. Therefore, the User's Choice Award for Operating Environment of the Year goes to Microsoft Windows.

Memory Management

I like Windows, and clearly I recommend that if you don't change to Windows, you should run Desqview. Either way, you'll need a memory manager; fortunately, the same one works for both. It used to be that QEMM and Windows had some problems, but no longer. Now they work together just fine. Moreover, installing QEMM-386 6.02 is a snap, and so is optimizing for either Windows or Desqview. As an example, we are looking at a Tandy 4033LX multimedia machine. It comes nicely integrated with Windows and CD-ROM and DOS extensions; the only problem is that as it comes, it has DOS windows of 530 KB. We installed QEMM and let the Optimize program do its thing; we now have 630-KB DOS windows on that machine.

I've looked at a lot of memory managers this year, and I have no trouble at all choosing Quarterdeck's QEMM-386 6.02 as the User's Choice for Best Memory Manager of 1991.

Windows 3 Secrets

If you use Windows, run, do not walk, to your nearest bookstore and get Brian Livingston's *Windows 3 Secrets*. Read the first four chapters, and I guarantee that you'll then know more about Windows

than almost anyone you know. This book explains in clear language just what Windows is doing, what it's trying to do, and what its programmers thought they were trying to do.

It explains undocumented features. It interprets the Windows error messages, including those that imply precisely the opposite of what they seem to be saying. It explains what standard mode is, and why you probably want to use it even though you have a 386 system. It tells you how to make Windows save your desktop without exiting and restarting (i.e., open a DOS application and attempt to leave Windows with the "save on exit" switch on; Program Manager will inform you that there are open applications, but before it finds that out, it has saved the current desktop). It tells you what the "About Program Manager" display in "Help" means (and it's nothing to do with help at all).

Finally, the book comes with two disks of shareware Windows programs that will make your life a lot easier.

I don't care how many Windows books you already have; get this one. If you have this one, it's not likely you'll need any other. *Windows 3 Secrets* hands down wins the User's Choice Award for the Best Windows Book of 1991.

Ascend

The Franklin Time Management System is one of the best known of the paper and notebook time management systems. It's usually presented in a 4-hour seminar that teaches and motivates you to use the tools. Of course, some people find all that unpleasant and aren't interested in time management systems and tools. I've even heard a few call the system inflexible. I don't see it that way. I find the Franklin system a useful way to organize my work and set priorities on what I want to accomplish.

Ascend is a Windows implementation of the Franklin system. It comes with forms and notebooks to hold the calendars and schedules that the program generates, a software implementation of the Franklin system, and tapes and workbooks that present the Franklin seminar about as you'd get it if you attended in person. The result is that you have everything you need to change your life.

Now, if you don't need to have your life changed, this program isn't going to do much for you. Some people are well organized and don't need any help. Others are hopelessly disorganized, and it's possible that this won't help them because they like being the way they are. For the rest of us, the Franklin system offers some hope.

Franklin is a bit different from its rival

THE **TOUCHE** COMMITMENT TO QUALITY AND VALUE KEEPS GROWING!

OUTSTANDING. That is the word PC Magazine used to describe our system! We're very proud of our 486-33 review and we encourage you to read it.

One example: Of 30 systems reviewed, **TOUCHE** ranked #1 in the small-record DOS access file test and #2 in the large DOS access file test for speed! To achieve this feat we relied on Maxtor and Ultrastor, two fantastic product partners.

Maxtor and Ultrastor are just two companies on a long list of companies we obtain high-quality components from to custom-build high-quality systems. AMI-SONY-Intel-Teac-Orchid-Keytronics-Micropolis-CYRIX-SIEMENS-PC Power & Cooling-BOCA are all names you'll easily recognize. You'll never see us offer components from **Fui-Manchui** or other tongue-twisting companies you've never heard of before.

WYSIWYG is a term used in desktop publishing. What You See Is What You Get is also a standard we use in building our systems. That means you get exactly what you expect when you receive your order from us. No hidden surprises or cut corners that many of our competitors try to sneak by with cheap or low quality components.

The use of AMI motherboards **guarantees** full DOS-UNIX-OS2 compatibility. We custom-build every system and offer special prices on enhancement items to upgrade your system like CD ROM's, digitizers, laser printers, scanners, 20" monitors, and hundreds of other products.

Our parent company, PC PROS, was founded in 1982. *Before you buy any system, ask all the hard questions and compare.* Who makes the motherboard? This is one of the most important questions to ask since this is the heart and soul of any computer. We use more AMI motherboards than anyone in the world. **Don't be fooled by claims of an AMI BIOS equaling an AMI motherboard.** Insist you receive a system with the best motherboard money can buy... an AMI.

Whether you're government, FORTUNE, major institution or just need a machine or two for your home or office, we offer the absolute best quality and service anywhere!

PATTON & PATTON
 Software Corporation

Excellence in charting the flow of ideas!

Day-Timer, because the essence of the Franklin system has to do with setting priorities and goals. But the schedules and calendars that Franklin generates are fairly similar to those in a Day-Timer. I used to carry a Day-Timer everywhere I went, but I found that I wasn't able to coordinate between information gathered on the road and the home-base calendar. Ascend uses the computer to do much of that coordinating for you.

If you've been hoping to find something that would let your computer help organize your life, this program may be it. In any event, it gets a User's Choice Award for Windows Applications Software.

The Far Side

The Far Side Computer Calendar won't change your life. It's just a good Windows-based calendar program. On the other hand, it's fun, with a different Larson Far Side cartoon every day and some animations done by Larson himself.

It has the standard features of a calendar, with schedules and alarms and suchlike, and it will print them out in reasonable formats. But you wouldn't buy it for that since there are shareware programs that do as well. The Far Side Computer Calendar gets an orchid because it's *fun*.

Database Applications

For ordinary flat-file database applications, we use Q&A. There's a new version, 4.0, that fixes most of the annoyances of earlier versions and makes several improvements, including adding mouse support. Do understand, the problems we've had with Q&A have been minor annoyances, not major aggravations. Q&A remains the easiest database to learn and use that we know. A technoklutz can sit down in front of a Q&A screen and be building database forms within an hour; within a week, he or she will be able to do Christmas cards and print the labels, handle inventories, log in receivables, and generate reports.

Q&A Write is similarly easy to learn as a word processor, and it's powerful enough for anything I need: I write all my books and columns with it. Indeed, I recently installed Microsoft Word for Windows, and while it's elegant and has many features Q&A Write will never have, it didn't take long before I installed a Q&A Write icon and brought that up in Windows. I suppose someday I'll learn Word for Windows, but what's the hurry?

Flat-file databases may not be enough. You may need a really powerful full relational database. Most people don't. One of these days when I don't have to cover a zillion awards, I'll devote a chunk of the column to examining when and why

New QEMM-386 v6.

"It's nothing less than a dream come true"
—Steve Gibson InfoWorld 8/26/91

Suddenly PC users have a lot of memory managers to choose from. Seems that everyone has figured out what users have been telling us for years: they need every last 'K' of available memory between 640K and 1 megabyte—especially if they're running on a network. Or using TSRs.

Our new QEMM-386 version 6 is the best way to get the most out of memory. It 'pools' all your memory so that it's available in whatever form your programs need—expanded or extended. You don't even need to know the difference. QEMM does it all for you. Instantly. Whereas DOS 5, for example, requires you to figure out what you need, then manually allocate memory and re-boot every time you need to change.

As for the all-important 'conventional' memory area, our new version 6 increases the amount of memory freed-up. Our exclusive 'optimize' feature automatically seeks out TSRs and device drivers and moves them into high memory—the area between 640K and 1 megabyte. All you need do is type 'OPTIMIZE'.

QEMM-386 v6 finds more high memory than any other memory manager. *Byte Magazine's* tests showed it produced net memory gains of 21K to 132K over DOS 5.0 alone, for instance.

#1
QEMM is the number one selling PC utility.

There's no better way to manage your memory.

What you can expect Automatic High Memory Gain Comparison

Stealth takes you to network and TSR heaven.

Our breakthrough 'Stealth' technology makes available areas normally taken up by ROM. Areas that QEMM-386 can use to load memory-hogging drivers and TSRs. Big programs can get the memory they need to run fast and efficiently. And

you get to have your TSRs.

Not every PC can benefit from Stealth. But every PC can benefit from 'Squeeze'—our new feature to manage those TSRs that need more memory at start up and less when they're resident. Memory allocation is temporarily increased, then squeezed down after it's needed.

QEMM can use idle video memory to produce a further 96K gain on EGA and VGA systems when running character-based programs.

A priceless bonus.

QEMM comes with Quarterdeck Manifest, the award-winning analysis program that makes it easy to see what's going on 'under the hood' of your PC.

See and understand how your PC works with Manifest.

Manifest does for memory what PC Tools Deluxe does for disks.

Benefits for Windows, too.

Whether you're running DOS 3, 4, 5, or Windows, QEMM can improve your 386/486's performance.

That means you may not need a faster CPU. You may not need more RAM. QEMM makes your favorite programs work better by giving them more memory.

QEMM helps you get the most out of the software you own today.

Quarterdeck

Quarterdeck International Ltd., B.I.M. House, Crofton Terrace, Dun Laoghaire, Co. Dublin, Ireland

Circle 114 on Inquiry Card.

you need a full relational database. In any event, if you do need one, I recommend Borland's Paradox, which is relatively easy to set up and is certainly powerful enough.

For Windows, though, you want an object-oriented database. For the moment, the best one of those I've seen is Bell Atlantic's Thinx, which I talked about in a past column. It's clever, the tutorial is sufficient for learning it, and it gets easier to use with practice. It's certainly powerful enough for most user needs.

I'm happy to give Q&A 4.0 and Thinx the User's Choice Awards for Best DOS and Windows Applications, respectively.

Clip'nSave

Several readers nominated this for an orchid. Clip'nSave makes it easy to capture Windows screens, save them in a BMP file, and convert them to different formats. There are detailed instructions on making your own wallpaper and a lot of information on bit-map formats and how they

work. It has the disconcerting feature of mucking up your desktop when you install it, but a quick trip to the control panel will fix that, after which you've got a great utility.

There's one problem. I've found a few conflicts between this and Windows 3.1. I suspect, though, that by the time you read this, the problems will be taken care of. In general, the readers are right: this deserves an orchid.

Trantor

I think of Trantor as a new company, but in fact, they've been around since CP/M days. They've since gone over to being specialists in SCSI. Their best-known product is the T338 MiniSCSI Parallel-to-SCSI Host Adapter, which enables you to use SCSI devices—CD-ROM drives, optical drives, and Bernoulli Boxes—with a portable computer. They also make Micro Channel SCSI boards and other stuff, and they're continually improving what they do; it's a company well worth watching.

A Chaos Manor orchid to Trantor, and a User's Choice Award to the T338 MiniSCSI Parallel-to-SCSI Host Adapter.

System of the Year

I like Windows and big 486 systems, but as time goes on, I get more and more attracted to Apple's Mac way of life. I had little use for the original 128-KB Mac, which I thought was an overpriced toy, but that was a long time ago. Since then, Macs have been greatly improved, and I note that many users who don't know or care what's going on inside a computer are able to sit down at a Mac and get a lot of work done.

One defect the Apple system had until this year was the lack of a decent portable. But that has been fixed with the PowerBooks.

Apple's System software was elegantly integrated, but MultiFinder did odd things and unexpectedly brought down the system at very inconvenient times. That, too, was remedied this year.

A large orchid to Apple: System 7.0 is great, and the Mac Quadra 900 is wonderful. I don't count it a defect of the Quadra 900 and System 7.0 that some older software won't run properly: Apple has been telling people for years that you must not write self-modifying code. Apple's programming standards are published and clear, for which Apple deserves yet another orchid. Two cheers for shipping machines like the Quadra 900 and the Mac Classic II with only 2 MB of memory when System 7.0 takes up more than half of that, but that's a minor quibble.

I think that the Quadra 900 and System

Electronics Workbench®

The electronics lab in a computer™

Powerful software to build and simulate analog and digital circuits.

Building and testing circuits is fast and easy with *Electronics Workbench*. Just click-and-drag with a mouse to add parts, run wires, and adjust instruments. The traces on the simulated instruments are the same as you'd get on real equipment.

Electronics Workbench really is an electronics lab in a computer. It's ideal for learning about electronics, experimenting, and prototyping circuits.

"Electronics Workbench is pretty amazing." - Jerry Pournelle, Ph.D., *InfoWorld*

DOS Professional Version - \$299
Macintosh Version - \$199

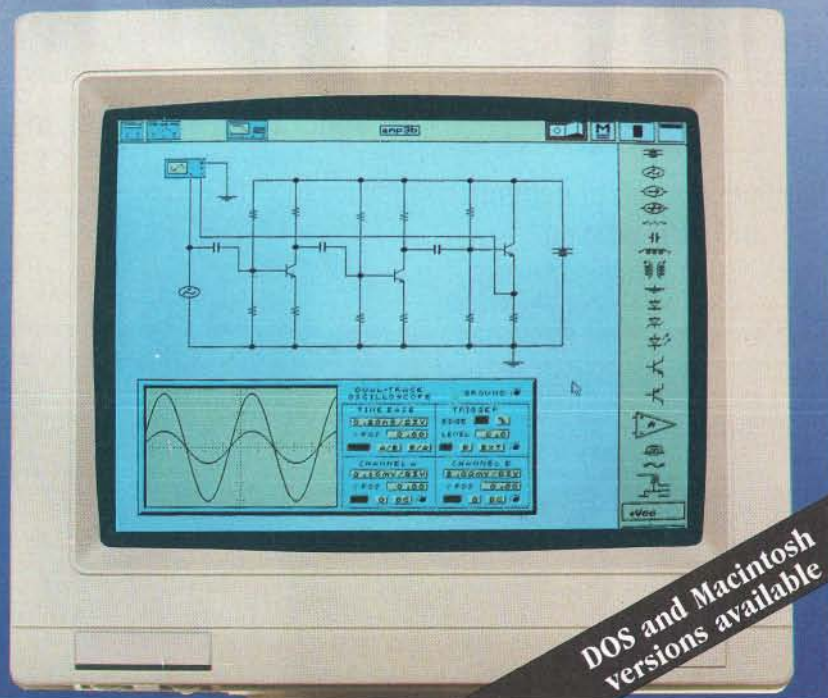

Electronics Workbench includes:

- **Analog Module** with passive and active components including transistors, diodes, and op-amps; a function generator, an oscilloscope, a multimeter, and a Bode plotter.
- **Digital Module** with gates, flip-flops, adders, a word generator, a logic analyzer, and a unique logic converter and simplifier.

USER'S COLUMN

Sound Blaster

One of the boards we installed in the Arche 486 was Sound Blaster. With its associated software, it has quietly (no pun intended, but what the heck) become the standard sound system for advanced PCs. The Roland board has much higher sound quality for a higher price, but for anything short of professional music quality, Sound Blaster is good enough.

One user, of course.

There are lots of other accessories you can get for Sound Blaster, including musical instrument software and a voice editor. Sound Blaster has become the standard sound board, if not for the industry, at least here at Chaos Manor. Recommended.

Jerry Pournelle

COMPUTE

SNEAK PEEKS

SOUND BLASTER PRO

In just two years, the Sound Blaster has become one of the most widely-supported PC sound cards.

It's easy to see why. The Sound Blaster contains an 11-voice FM synthesizer that makes it fully compatible with the popular Ad Lib Music Card. The day it hit store shelves, the Sound Blaster could be used with hundreds of Ad Lib compatible games and educational programs. To add even more value, the original Sound Blaster included a DAC (Digital to Analog Converter) for digitized voice and sound effects, a microphone jack for voice input, a built-in game port, a built-in 4-watt amplifier, and an optional MIDI interface.

The built-in mixer makes the Sound Blaster Pro fully compliant with Microsoft's Multimedia Level 1 Extensions to Windows. Multimedia software will be able to fade-in, fade-out, and pan the various audio sources to create elaborate sound montages.

The Sound Blaster Pro includes a CD-ROM interface for either an internal or external CD-ROM player.

There's also an internal connector for CD-Audio. The MIDI interface is compatible with the original Sound Blaster's MIDI interface, but adds the MIDI time-stamp that's part of Microsoft's new multimedia standard.

All in all, the Sound Blaster Pro is chock-full of new features, yet it's fully compatible with its younger brother.

PC HOME JOURNAL

SOUND BLASTER DOES IT ALL

Review by Harvey Bernstein

The Sound Blaster has so many audio applications packed into one half-sized board that it almost boggles the mind. First, it has an 11-voice stereo music

synthesizer that is fully compatible with the widely used AdLib sound format. Older software that only supports the AdLib board will automatically turn on the AdLib mode—no adjustment by the user is necessary. A separate channel is exclusively for reproducing digitized speech. A microphone jack on the back of the card allows you to digitize your own input voices. With a 4-watt stereo amplifier built in, you can run speakers or headphones directly from the card—no additional amplification is necessary. A standard joystick port also doubles as a MIDI interface, allowing you to connect a synthesizer or any other MIDI instrument. Combine this with an excellent library of software, and it is easy to see why the Sound Blaster has become so popular.

The Sound Blaster Pro is the Sound Blaster worth the investment? Yes, yes, a thousand times yes!!! When you hear how much the Sound Blaster increases the capabilities of your PC, you'll wonder how you ever got along without one.

PC

SOUND BLASTER PRO

By Barry Brenesal

The Marines may look for a few good men, but any PC game player will gladly settle for a single good sound card: one that plays both Sound Blaster and AdLib scores, one that doesn't fly your other boards, one that never draws attention to itself, one that delivers all the sophisticated sound effects and music bundled into the latest batch of game software.

Look no further: Sound Blaster Pro does it all, and more. At \$299.95 it's not cheap, but neither are its features.

Testing: One, Two

Installing Sound Blaster Pro is a snap. The 16-bit card slips easily into place. It comes with a test disk that

Trying out Sound Blaster Pro is a treat. It's got great frequency response—that's the difference between listening to a film score on a tinny, muffled AM radio and hearing it on a stereo movie-theater speaker system. The orchestral soundtrack to Origin's Wing Commander is a good example, because it changes mood and melody to match the success of your current battle. Add Sound Blaster Pro to a good VGA screen and a responsive joystick (which you can plug into Sound Blaster Pro's joystick port), and the illusion of dogfighting aliens in a George Lucas-style film becomes 3-D, symphonic reality.

Another plus is the absence of the annoying background hiss that

In short, Creative Labs' Sound Blaster Pro is a big winner. It's quick to install, easy to use, full-featured, and compatible with Sound Blaster and AdLib files. Signal response is excellent. And don't forget about the

Now you can get the number one sound card as part of our new Multimedia Upgrade Kit. Which also comes with a MIDI kit, an internal CD-ROM drive and 5 CD-ROM titles, including Microsoft® Bookshelf® and Windows™ with Multimedia Extensions. In all, \$2,000 worth of goodies for just under \$850.

So before you get into multimedia, call 1-800-544-6146 or see your dealer. You'll like what you hear.

7.0 are a giant step forward for computer users and now set the new standard for productivity—as well as being a lot of fun to use. The Chaos Manor User's Choice Award for Machine of the Year goes to the Quadra 900.

Portable Computers

This was the year I abandoned my back-breaking Zenith 386SX portable. It's not that it isn't a great machine; indeed, once I get to my destination, I sometimes wish I had brought it for the large bright screen and big keyboard. On the other hand, I don't miss lugging 20 pounds of computer, case, power supply, and accessories while racing from gate to gate to catch an airplane.

This year, I tried a number of portable machines and one palmtop. I found that I'm too set in my ways to make much use of a palmtop, but my son Phillip uses a Poqet every day. He's a Navy officer and has found the little machine invaluable and rugged enough for his needs. He does advise that you get rechargeable batteries and a recharging device, since his early version of the Poqet uses up penlight batteries like mad.

I used about a dozen notebook computers this year, and two stood out: the Safari NSX/20 and the TravelMate 3000 WinSX from Texas Instruments (TI).

We've taken them both all over the country. The TravelMate bounced around in the Bronco while we drove down to Baja for the eclipse, and the NSX/20 traveled with us to Tahoe for the Hackers' Conference and then down to Las Vegas for Comdex.

The TravelMate is preferable as a general-purpose DOS and sometimes Windows machine, largely because the ROM character set is more aesthetically pleasing. It's also better for Desqview users because it is able to use QEMM's Stealth technology to get larger windows.

The NSX/20, on the other hand, has wonderful provisions for communications and does Windows extremely well. Also, it is a more handsome—and handy—unit. I especially like the battery arrangement that lets you change batteries on the fly.

In a word, they're both good enough. What's happened is that Roberta, who still prefers Desqview to Windows, has taken over the TravelMate. She now carries it in preference to Toshiba-san, the Toshiba T1000 she's had for many years. Given that the TravelMate weighs about twice what the T1000 does, that's quite a concession. That leaves the NSX/20 for me, which works out well because I'm working hard at getting used to Windows; also, I do much more communications, includ-

ing faxing, when I'm on the road. What I really like is that TI and Safari Systems aren't the only companies working on improving laptop computing.

I'm pleased to give User's Choice Awards to the TravelMate 3000 WinSX and the Safari NSX/20.

Logitech TrackMan Portable

Safari considered the Microsoft Ballpoint mouse, which was my previous favorite choice for a pointing device for portables, but chose the Logitech TrackMan Portable trackball to bundle with the NSX/20—a wise decision. Whatever portable you get, if you use Windows, get the TrackMan Portable. It's wonderful. In fact, it's so good that I am strongly tempted to attach it to the keyboard of my regular machine and abandon regular mice altogether. This gadget just plain feels right. It's also rugged enough for portable use.

A very large Chaos Manor orchid and a User's Choice Award to Logitech for the Pointing Device of the Year. Try this one. I bet you'll love it. I did.

CD-ROM

There were about a zillion CD-ROMs this year, far more than any one human could keep track of. However, one stands out above the others: the Bureau of Electronic Publishing's Monarch Notes are likely to have a major impact on the country. Monarch Notes, like *Cliffs Notes*, are short booklets that summarize various great works of literature, point out the intellectual lessons, draw conclusions, and ask questions.

They are supposed to be used in conjunction with the works they discuss rather than as a substitute for reading them, but we all know how that goes. I suppose it was inevitable that CD-ROMs would not only make available the world's great literature, but also make it easier to avoid reading it and still get college credit. Putting every one of the Monarch Notes on one CD-ROM certainly hastened the process. Having said that, I sure wish I'd had this disc when I was an undergrad; and on reflection, I think every college literature teacher had better get one in self-defense.

In any event, the User's Choice Award for CD-ROM of the Year goes to Monarch Notes from the Bureau of Electronic Publishing.

Games

This is an unusual situation. I had already chosen Broderbund's Patton Strikes Back, a Battle of the Bulge game by Chris Crawford, the genius dean of war-game designers, as game of the month and a candidate for game of the year. Like all

Crawford designs, it's unique. The bias is toward playability and just having fun, and it does that. It also presents live-action video in small pop-up screens. There are sounds, advice from generals, and just all kinds of interesting features.

Then, just before Christmas, came another box: MicroProse's Civilization, the newest game by Railroad Tycoon designer Sid Meier.

"Too late to be considered," I thought, as I opened it. "But it doesn't hurt to have a look."

Six hours later it was dawn, and I was still playing. Look: do yourself a favor and do not buy this one just when you have an important deadline coming up. It's fascinating. Worse, it's addictive. Maybe more than addictive. In theory, it resembles the Avalon Hill board game of the same name; in some ways, it resembles Mark Baldwin's classic Empire; and overall, it's like nothing you've ever tried before.

Like Patton Strikes Back, you can play Civilization with very little attention to the manual; but like Railroad Tycoon, you will not play it well unless you study the manual very closely. This is a complicated game, and everything interacts with everything else. I like Crawford's game a lot, but Civilization stands out as the Chaos Manor Game of the Year and gets the User's Choice Award for that.

Winding Down

The CD-ROM of the month is Library of the Future, Series Second Edition, from World Library, Inc. (12914 Haster St., Garden Grove, CA 92640, (800) 443-0238). Nine hundred titles on one CD-ROM for \$695.

There's more here, and I'm out of space. Next month, disk drives, both conventional and optical, CD-ROM drives, modems and communications, and backup systems. I'll be giving out more onions and orchids (including the Orchid and Onion of the Year) and more User's Choice Awards. I'll also have a look at multimedia and make some predictions about the Brave New Worlds the computer revolution is bringing us. ■

AMI EISA

The Only Game In Town

For EISA, there is only one player to consider—AMI. Whether it's motherboards, BIOS, utilities, or SCSI host adapters, AMI is the single source for advanced EISA technology.

ADVANCED EISA & MODULAR CPU MOTHERBOARDS

With AMI leading the way in EISA motherboard designs, you will benefit from bulletproof performance and proven reliability.

- EZ-Flex—A new modular CPU design offering easy upgrades to future technology.
- Enterprise II—A proven EISA performer, popular for critical applications.

THE LEADING EISA BIOS

AMI is the world-wide standard for BIOS. AMI's EISA BIOS provides the reliability, compatibility, and features you desire. Plus, it's compatible with AMI's BIOS Configuration Utility, providing on-site customization for the Integrator or OEM.

Circle 40 on Inquiry Card (RESELLERS: 41).

AMERICAN MEGATRENDS, INC.

800-U-BUY-AMI or 800-828-9264, 404-263-8181, fax 404-263-9381

EISA UTILITIES MAKE THE JOB SIMPLE

AMI designed and developed the EISA Configuration Utility to make configuring EISA products a snap. Run the ECU and select the auto configuration option, or modify the I/O ports, interrupts, or DMA settings as you desire.

EISA ADD-ON CARDS

The Fast Disk EISA SCSI Host Adapter, with a combination of 16 MB cache, and intelligent 386SX I/O management, is the fastest SCSI host adapter on the market today. Look to AMI for other EISA cards in the near future.

THE AMI DIFFERENCE

AMI's expertise covers the entire EISA environment. With research, engineering and support functions under one roof, AMI is unmatched in knowledge and support. Call AMI, and you will understand why AMI's "monopoly" on EISA makes it the only game in town.

WORM
(DD-S5101)

CD-ROM Minichanger
(DRM-600)

Multifunction
(DE-S7001)

WE DIDN'T HAVE TO PUT OUR OPTICAL PRODUCTS ON PEDESTALS. JERRY POURNELLE DID.

“ I am pleased to report that I'm sold. The Pioneer optical drive... is as solid as a rock. ... Thus, I'm discontinuing testing. Now I'll just use the drive. ... I now rely on the Pioneer erasable optical disks for backup, for primary storage of really big files, and for archive copies of software... you really need something so easy to use that you'll routinely use it for backup... the Pioneer DE-S7001 will do the job very well indeed. Recommended. *Byte* (9/91)

The Pioneer six-pack CD-ROM Minichanger is great. We've had it in operation for the best part of the year now, on a number of different systems. ... It has always performed flawlessly... it changes drives a lot faster than you'd expect it to. ... It's really fast. ... Accesses that used to take many seconds are now nearly instantaneous. Accesses that took over a minute now take a few seconds. I always did like the Minichanger. ... Now it's even better. ... Incidentally, the Pioneer Minichanger will work just fine with a Mac. *Byte* (10/91)

The Pioneer DE-S7001 dual-purpose external optical disk drive I've written about before. Log your wordprocessor to that, save early and often, and you'll have it all. ... In a word, WORM drives look like

the ultimate in backup storage. *Byte* (12/91)

Suppose you erase a file? Overwrite one you wanted to keep? And suppose your house burned down? You don't have any off-site backup at all. ... I could remedy that by installing the DE-S7001 on the network server and archiving on that. ... *Byte* (11/91)

I have the DRM-600 running not only with QEMM386.SYS, but inside DESQview windows, which has the amusing result that I can actually have several CD-ROM windows open at once. ... It's surprising how fast you can switch back and forth among them. ... The Pioneer DRM-600... it's very convenient to have a bunch of CD-ROMs available without swapping. *Byte* (1/91)

It's quite intuitive [the Pioneer CD-ROM Minichanger]: no instructions are required. ... Recommended. *Byte* (1/91)

This technology is coming of age. *Byte* (1/91) **”**

RENOWNED COMPUTER COLUMNIST

BYTE editors debate the issues with contributors, readers, and industry experts

THE FUTURE OF PEN COMPUTING, PART 2

Roundtable is a forum in which BYTE editors, contributors, readers, and industry experts debate key issues that affect how you purchase and use hardware and software. The "conversations" take place on BIX, where you can participate in the roundtable conference.

Last month, we talked about the markets for pen computers and the competing pen operating systems. Let's turn now to hardware issues. In many cases, pen computers have to be able to run for an entire workday without being recharged. What impact does that have on system design?

NEIL KATZ: Vertical users require that their batteries provide at least a full day's work. With current 386 designs and [the need to] minimize weight, this is virtually impossible. However, most vertical users do not run their machines continuously for 8 hours. They need a system with sophisticated power management. The system should sleep and draw minimal power when not in use.

Also, vertical users are more sensitive to battery life than laptop users are. When you're mobile, outside, and away from AC power, battery life becomes even more critical.

DAVID MENTLEY: It's amusing to see new microprocessor designs that save a few hundred milliwatts while the backlight for the display takes 3 to 4 watts. LCDs themselves burn up about half a watt. Nickel-cadmium batteries store about 40 watt-hours per kilogram or 18 Wh per pound. So a 1-pound battery at a 4-W consumption rate provides only 4½ hours of operation—when everything is working right. This analysis is just for a monochrome display. You can double the consumption, at least, for color.

These are not just temporary obstacles. Increasing the efficiency of backlights (both tube and film types) and batteries is more than a simple engineering task. Thousands of people have been working on it for decades. The question is whether or not you need a backlight. The clipboards clearly do not need it. Everything else does.

In bright, ambient lighting, [nonbacklit monochrome LCDs] reflect more light and look better. Backlit units

look nice in a dark room and get progressively worse as the ambient lighting increases. A compromise is needed for covering both indoor and outdoor applications.

In the near term, a lot of these systems are going to be plugged into a vehicle's cigarette lighter socket if they are to be used all day.

Handwriting recognition is very slow on today's pen computers. Can we expect dramatic improvements in the near future?

JEFF DAO: The perception that handwriting recognition is too slow happens when people wait for the recognition response after writing each character. Those who write continually and naturally usually have the impression that current technology is fast enough.

DAN BRICKLIN: Current handwriting recognition is fine for many uses. For naming files, index topics, or objects, it often beats going from a mouse to a keyboard. When choosing from a constrained list (numbers only or city names, for example), many pen systems are quite good.

NICHOLAS BARAN: The single-tasking pen operating systems will not be able to offer the necessary performance for responsive handwriting recognition. But for basic forms entry, Communication Intelligence Corp.'s (CIC's) PenDOS, a pen-aware driver on top of MS-DOS, may be all that's necessary, let alone Windows for Pens or PenPoint.

STEVE LIFFICK: Unfortunately, handwriting recognition will never meet the expectations of the public at large. I tell folks who are disappointed that they should go back and try to read something they wrote a few weeks ago. How many letters can they make out? Is it reasonable

ROUNDTABLE

[to expect] a machine to read their writing better than they do?

There seems to be a consensus that handwriting recognition is slow. That hasn't been our experience with Windows for Pens. It recognizes *behind* the writer as text is being entered, so the delay upon finishing should never be very long—in essence, just enough to make segmentation (letter break) determinations and shape matching for the last two characters. This results in nearly immediate response.

We developed our recognition algorithms from the beginning to support cursive recognition. The problem boils down to insufficient CPU horsepower. The segmentation problem becomes worse by an order of magnitude because of ligatures. Combine this with the fact that people tend to write cursive more sloppily than block text, and one ends up with a requirement for lots of prototypes and lots of computation to perform recognition.

The situation with block versus cursive text recognition is analogous to interrupted versus continuous speech recognition. Continuous speech recognition is possible. It just takes a lot of CPU power.

DAO: Current handwriting-recognition technology uses a variety of methods: AI, neural networks, and fuzzy logic. Whatever one chooses to call it, handwriting-recognition software attempts to emulate what humans do very well at a very young age. We are exceptional recognizers, or image processors. We do a lot of pre- and postprocessing that these glorified calculators have not even begun to tackle. Yet the technology is useful in its current form with mixed upper- and lowercase printing. CIC's recognition system keeps up with a writer writing 30-plus words per minute. This is more than adequate.

As for cursive recognition, we're talking about a lot more million instructions per second [MIPS]. CIC already has a CR system running in the lab; however, today's 386 CPUs are not adequate for CR. Expect hardware capable of running a commercial CR product from CIC in a year's time.

What improvements will pen-computer designers make to achieve adequate performance, weight, display quality, and battery life at a reasonable price?

MENTLEY: I wouldn't look for full-color video-capable flat-panel displays on pen computers in the near future. Color-active matrix LCDs must have a backlight that requires 8 to 15 W of power. Other light-emitting flat panels are not yet available in full color, but when they are, they will be in the same power-consumption range as

backlit LCDs. Another problem is the thickness. Placing the backlight behind the display makes the module nearly an inch thick. Light pipes and edge-mounted lights help, as Sharp has demonstrated with an edgelit active-matrix LCD for notebook computers. Digitizers also absorb light, increasing the backlight requirement.

Faster supertwist monochrome displays are clearly the trend. Supertwist technology is inherently slow, but producers (all in Japan) are desperately trying to get the speed up to video rates. The response time is temperature sensitive, however, and this is where pen computers may get into trouble. LCD response times get down to 1 second or so at winter temperatures. This leads to serious cursor "submarining."

On the other end, many of these pen computers are going to be sitting on car seats in direct sun in the summer. LCDs don't like high temperatures. The vertical-market environments are going to be much tougher on these systems than the broad-based horizontal applications in which we find laptops.

BARAN: There are several possibilities for storing data—PC cards with capacities of up to 16 MB are already available, and 40-MB cards are expected in the next couple of years.

Certainly, wireless networks will play a role, and PenPoint supports the AppleTalk network protocol. But again, PC cards will be the primary storage medium.

The PCMCIA memory-card specification is becoming the standard storage medium on pen-based systems (Momenta notwithstanding). And undoubtedly, there will be database applications designed to operate with these memory cards. However, this is all under development—not available right now.

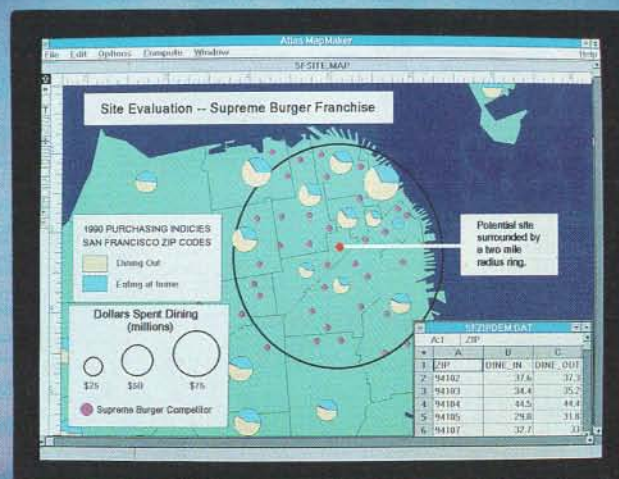

Might stylus-based systems be integrated with voice-based systems in the future?

LIFFICK: The integration of voice and pen control is inevitable. The strengths of the pen complement perfectly the weaknesses of voice input. Voice is inherently undirected. The pen is inherently very directed. Combine [voice recognition] with scenarios where the pen is appropriate, and the future of the pen is ensured.

The major factor delaying voice input in the marketplace is CPU speed. The 386 cuts it for unconstrained (i.e., no required grammar) interrupted small-vocabulary input. High-end 486s bump up the vocabulary considerably for interrupted input and enable continuous input for a very small vocabulary. But if one considers

ATLAS SOFTWARE

A NEW DIMENSION IN DATA MANAGEMENT

Most business and government professionals view and analyze data only on spreadsheets, databases and occasionally in business graphics packages. While these types of software are useful for displaying statistical data, they fall short of communicating information about geography—such as income by sales territory, population by county, or customers by ZIP codes or street addresses.

Atlas Software® is changing that. By linking data from spreadsheets, databases and even other applications—on your PC or Macintosh®—you can now add the important geographical dimension to your information system.

And when we say important, we mean mission critical. For example, Atlas Software can help business professionals answer “what if” and “show me where” questions for optimizing sales territories, targeting customers, and selecting ideal site locations. Government professionals can use Atlas Software for everything from political redistricting to land-use planning and public safety analysis. Without Atlas Software these tasks would be difficult or impossible.

Atlas Software programs come equipped with built-in data management capabilities, map file importing and a generous base map and data sampler from our comprehensive library,

containing over 75 gigabytes of geographic files, business statistics and demographic data.

Atlas Software comes in a variety of “flavors” to suit your specific needs and supports MS DOS®, MS Windows® and Macintosh operating systems.

So if you're ready to add a dynamic new dimension to the way you use information, like 25,000 other Strategic Mapping customers, call us for a free Desktop Mapping Guidebook and demo disk. We'd be happy to map out a plan for you.

How would you sum up the current state of pen computing?

As the handwriting-recognition people point out, we need more MIPS. We need them for better recognition. We also need them to make the screen respond fast enough to feel "as good as paper, and better" (Slate's motto). When you turn a page, it should turn instantly. "Ink" should look as sharp as it does on paper but take up as little storage space as possible.

The economic reality of pen computing is that inexpensive machines appropriate for the masses are two years out. There will always be "heat seekers" adopting the technology before it is economically reasonable to do so. But the large market for pen computing in the next two years will be with those entities that can justify its price in terms of real and immediate cost benefits. Those entities are corporations seeking increased productivity and prospective notebook buyers looking to extend the reach and scope of their current computing power.

[It will take] hardware that is competitively priced, rugged, easy to use, and lightweight. More important, [it will take] an operating system and set of applications that are intuitive and friendly and present a noncomputerlike interface. All aspects of input will need to be brought to bear to make this market happen, including handwriting, voice, and wireless communications. The synergy of these will make this new market take off. ■

[illegible]

Why do they call it a dongle?

He wasn't famous. He didn't drive a fancy car, but dressed in his favorite Comdex T-shirt and faded blue jeans, he set out to change the course of the computer software industry. Quite a task for a lonely software developer.

Sitting in front of his

computer, drinking pots of coffee and smoking cartons of cigarettes, he'd write pages

of code.

It took time. Years in fact. But he did it. He wrote the most powerful computer program in the world. Now came the hard part. Selling it.

The Most Powerful Program in the World

Determined to make those long years pay off, he called on every distributor, VAR and dealer in the world. He drove from Beantown to San Diego. Flew from Dublin to Borneo. Everyone loved the program.

So he sold a few. Only a few.

Back in Boston he waited. After a long year

with only 13 orders he set out to see what happened. As he drove across the

country and flew around the world he

discovered everyone knew about his program. Everyone had it too.

The Global Marketplace

From Paris to Prague, his program was everywhere in Europe. When he got off the plane in Hong Kong he found his program stacked to the ceiling in every computer store. Amazed in disbelief, he bought a hundred cartons of cigarettes and a hundred pounds of Indonesian coffee and flew back to Boston.

Beaten, battered and bruised he went back to the drawing board. This time he would really change the face of the software industry. He would develop a device that would prevent unauthorized distribution of software programs.

Call It What You Like

He developed a hardware key. His peers applauded his efforts. Finally, a solid solution for revenue protection.

But he didn't know what to call it. He thought of naming it after an exotic place he visited in his travels. Madagascar was a bit too long, though.

"Name it after you, Don!", urged his peers. So he did. Soon everyone was calling the key a dongle, after Don Gall — the lonely software developer who did what he had to do.

You've Come A Long Way, Baby

Today, dongles are different. Fact is, they've come a long way. Leading the industry with security solutions, Rainbow Technologies has changed the face of hardware keys. They work with multiple applications, are programmable and network versions control concurrent usage. And they're always transparent to the end-user.

Sentinel Family from Rainbow

Truth is, more and more developers are using keys. And the Sentinel Family is the most widely used in the world. In fact, over 6,000

developers use Sentinel from Rainbow. Why? They are simply the most effective, reliable and easy to implement keys on the market.

Learn more about securing

your software and how keys provide developers with extra value.

Call for a free copy of "The Sentinel Guide to Securing Software." And see just how easy it is to

install a hardware key into your application in just minutes. Try it with our low cost Sentinel Evaluation Kit.

Order one for your DOS, OS/2, Windows, Macintosh or UNIX based application.

And remember, when you need a dongle, you need Sentinel — the only dongle Don Gall would use.

Practical Desktop Video

**PART 1 - The BYTE Multimedia Lab introduces desktop video production
in this first article in a series on desktop video**

TOM YAGER

Few things in today's world are growing faster than our dependence on video-based information. The video medium incorporates the elements of color, movement, and sound in a way that we're powerfully drawn to. As a result, video can persuade and motivate more effectively than any other medium. It's no wonder that advertisers spend billions of dollars each year producing ads and placing them on TV: If you've got a point to make, you presently have no more efficient path into other people's minds than through video.

Today the power of video communication can be applied in a way you might not have considered: as a vehicle for *your* message. Desktop video production means that you, with the help of a computer, can express your ideas through sights and sounds that can make a powerful impression on your audience.

This article, produced by the BYTE Multimedia Lab, is the first in a series on desktop video. The focus of the series will be on practical uses for existing video technology. At the end, you'll know enough about desktop video production to get started creating your own professional-looking videos.

What Good Is It?

Even if you're willing to take for granted that you *can* produce your own videos, you might wonder why you'd ever want to. Consider this example: You run a construction company, and you're bidding on a contract for a huge office building. The client firm is looking for skill, experience, and an uncompromising dedication to quality. How do you convince the client's representatives, in the short time you have their attention, that your firm has these qualities and deserves to be placed above the competition? Today you'd probably pitch to them using time-honored methods: overhead transparencies, flip charts and magic markers, and perhaps even 35mm slides. The overheads might summarize your company's financial history, the flip charts might show rough plans for the project under consideration, and the slides might depict similar buildings already constructed by your firm.

The problem with these presentation methods is that they do nothing more than put dry facts in front of your audience: Everything else is up to you. When you place your presentation on video, however, all you do is insert the cassette and press Play—the presentation speaks for itself. No facts are forgotten, no slides get inserted upside down, and no smudges or fingerprints obscure your message.

Beyond such mundane considerations, video lets you present facts and figures as

computer graphics—using animation if you like. The graphics can be interspersed with live video, voice-overs, and music that advance the audience's respect for your company and ensure that the facts are interpreted the way you want them to be. The building plans can become a virtual prototype—a shaded, three-dimensional model that you can view from several angles, rotate, and even place in simulated surroundings. Video lets you transport

Video can provide the edge that gets you, your ideas, and your company noticed.

your audience to other places. You can take them to a building site where your engineers can be seen working closely with construction crews, include them in a planning meeting where your staff is discussing a project similar to the one in question, and let them see the people behind the numbers and the plans. Finally, you can show them your completed projects.

The value that video adds can be seen in several ways. Of the traditional methods mentioned earlier, none offers the combination of sound, color, and motion. Video combines them all, and these things attract and hold an audience's attention. Also, a well-done video presentation always makes a more professional impression than a stack of transparencies or slides. Finally, video is unique in its ability to condense information. A 5-minute video can hold the equivalent information of innumerable transparencies because you have the freedom to combine graphics, video, voice, music, animation, and other elements to tell your story.

You'll see as this series progresses that video works well in settings outside the boardroom, too. In these days of intense competition, it can provide the edge that gets you, your ideas, and your company noticed.

Its Noble Heritage

Computers have a long history of involvement with video, dating back to the days when videotape recorders (VTRs) were first cabled to specialized computers called *edit controllers*,

so raw video could be edited into a finished product. Like most of desktop video's roots, these early editing systems were expensive and were seen mostly at TV stations and organizations with deep pockets and a knowledgeable staff. Specialized computers were also used to switch smoothly from one video signal to another, as when a newscast goes from the anchor to a tape, back to

the anchor, and then to the weather reporter.

More expensive versions of these systems (called *switchers*) could do more than just cut or fade between two video sources: They could apply special effects. The least of them did *wipes* (i.e., the new video replaces the old in a sweep across the screen), but the best of them could do advanced effects like mapping video sources to the sides of a cube and spinning it through space. Computers were also used to generate text (*character generators*) and graphics (*paint systems*). There are many other examples of computer technology in video, and the amount of digital hardware used in today's broadcast and professional facilities far outstrips what existed in the early days.

Even today, however, many of these capabilities—editing, switching, special effects, character generation, and graphics—are handled by several specialized systems capable of doing nothing else. The old-fashioned edit controllers still exist, as do stand-alone character generators and specialized graphics systems. To be fair, each has advantages (though sometimes small) over its desktop video equivalent.

The Quality Question

Among the advantages of expensive, component-based gear is quality: Everyone who spends large sums of money on specialized equipment expects *broadcast quality*. That's a phrase you'll hear often in association with video, and it has different meanings depending on who's saying it. For our purposes, I'll simply place broadcast quality as a far right tick on a quality scale. It's the best you can get, and to get it, you need to invest in the kind of gear you'd find at CNN or CBS. On the far left side of the scale, place a tick at consumer-quality, or hobby-level, video. This is where standard VHS VCRs and most camcorders fall. You can also find inexpensive titlers, editors, enhancers, and other modules at this level, but what works well for video snapshots falls apart on a 20-inch monitor in the boardroom. And what starts out bad only gets worse during editing and duplication processes.

Our domain will be somewhere between these two boundaries. Between consumer quality and broadcast quality lies a somewhat newly defined market area known by several names. Some call it *prosumer*, while others call it *industrial*, or *commercial*, quality. Whatever you call it, it's easy to spot. The video side is dominated by equipment that often looks and acts like broadcast gear but is at least slightly less capable. The VTRs and players themselves are tuned to producing stable, high-quality images with enhanced resolution (compared to VHS).

But perhaps most important, most video gear in this category can be computer controlled. That's where the real computer assist comes in. The computer takes control of the VCR, telling it when to play, record, pause, and so on. If you add a card to your system that handles an incoming video signal, you can display what's playing on the tape on your computer's monitor. If that card also has a video output, you immediately gain the ability to take an incoming video signal, add computer graphics to it (e.g., a title), and send it back out again to be recorded. Once you've done these few things (and added the not-so-incidental software, of course), you've built yourself a very inexpensive editing, titling, and graphics system.

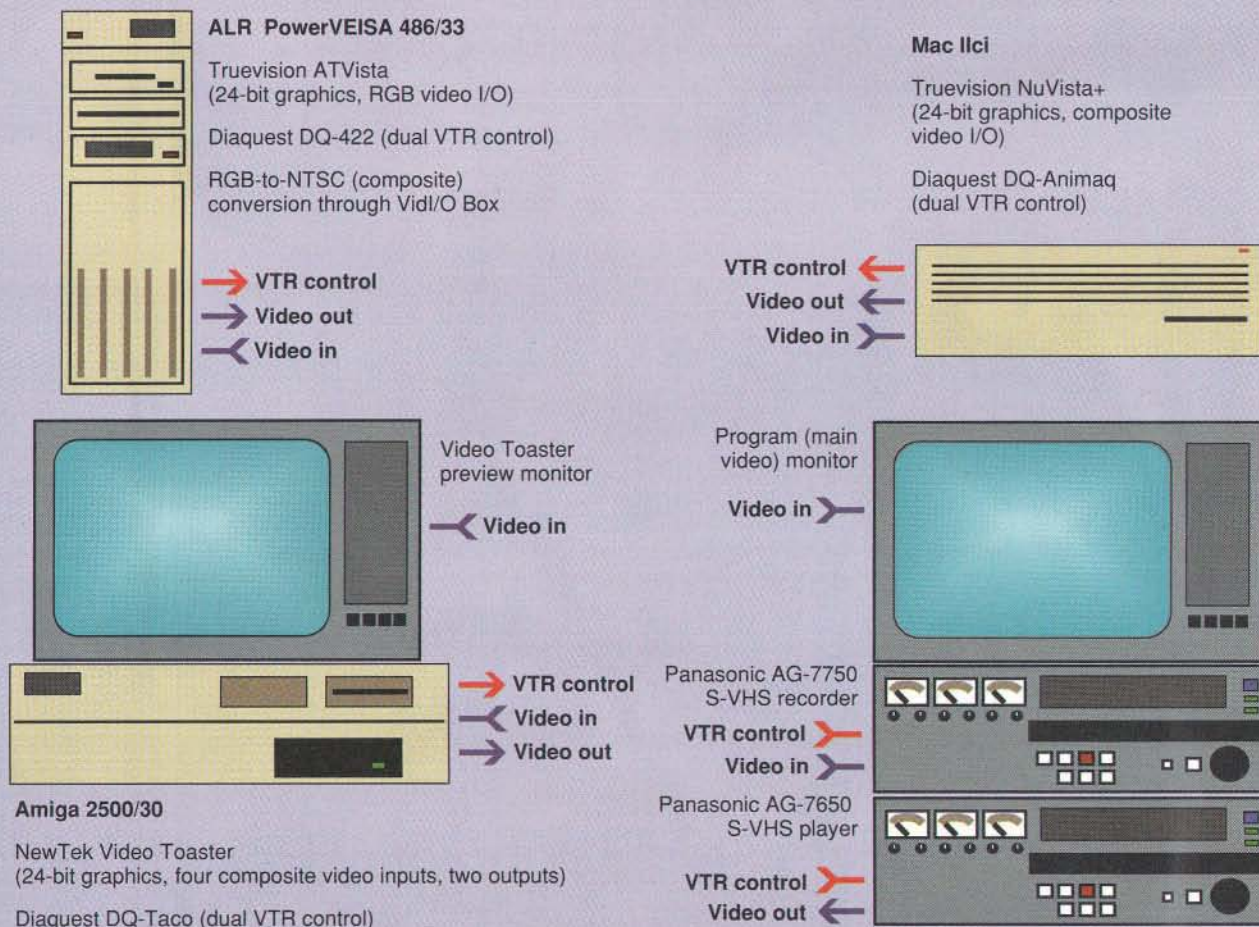

The Multimedia Lab

This feature series on desktop video is the first major undertaking of the BYTE Multimedia Lab, and there's a reason desktop video is the first subject. Among the many concepts and technologies that come under the multimedia umbrella, desktop video has developed to the point where widespread adoption and

BYTE ACTION SUMMARY

Video presentations are unparalleled in their ability to make a point. With technology available on the desktop today, you can harness the power of video for your own presentations.

MAKING CONNECTIONS

All three systems in the BYTE Multimedia Lab are equipped to handle video I/O. The end of the line is always the video input of the AG-7750 S-VHS VCR. If only the real interconnections were as neat and manageable as in this diagram.

use is possible. While standards for other types of multimedia applications are just beginning to emerge, it's already possible to build effective desktop video setups around the platform (more or less) of your choice.

Like BYTE, the Multimedia Lab takes a multiplatform view of the world. I decided to employ three systems I believe represent the bulk of BYTE's readers. The PC system is an ALR PowerVEISA 486/33 with 13 MB of memory and a 600-MB hard drive. The Mac IICI has 8 MB of memory and an 80-MB hard drive. The Amiga 2500/30 has 7 MB of memory and a 370-MB hard drive (330 MB of which is on a Micropolis SCSI drive I installed). You'll notice that these are all pretty beefy configurations—everything you've heard about multimedia being demanding of memory and disk space is true.

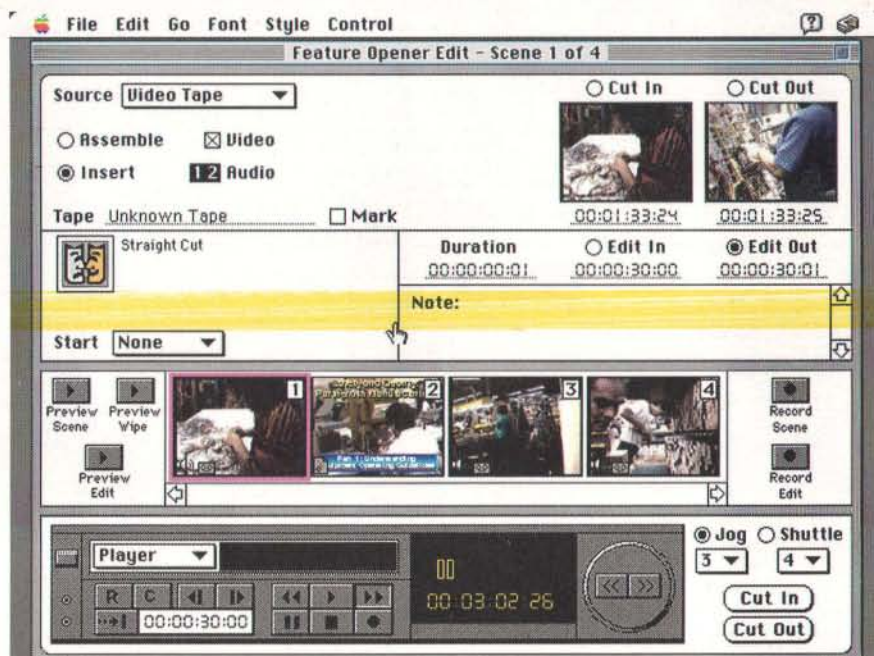

The video-related hardware came next. Since I'm not evaluating products per se, I chose not to duplicate equipment where it could be avoided. In this endeavor, three veterans of the video industry—Panasonic, Diaquest, and Truevision—made building the lab much easier. Panasonic provided most of the video equipment: a pair of computer-controllable Super VHS video decks (one AG-7750 recorder and one AG-7650 player), three (model

BTM1310Y) professional monitors, and a Super VHS camcorder. Diaquest outfitted all three computer systems with the video-synchronized, intelligent serial interfaces needed to control the decks. They not only tell the decks what to do, but also collect input from the decks regarding tape position, status, and so on. The Diaquest DQ-422 board in the PC also acts as the main source of video synchronization for the entire lab. (Its importance will be made clear in the next article.) The Mac and the Amiga have DQ-Animaq and DQ-Taco boards, respectively.

Truevision provided the professional video cards for the PC and the Mac. The PC's ATVista card uses an external signal converter (called the VidI/O Box) to translate composite (or recordable) video signals to RGB for processing and then convert the board's RGB output to video for recording. The ATVista doesn't replace the PC's main display card, so it must be specifically supported by applications. Fortunately, the ATVista is popular enough that support is widespread. On the Mac, the NuVista+ handles video I/O directly (without the external converter). Both cards offer 24-bit (or true color) graphics, video overlay (i.e., computer graphics added to an incoming video signal), and limited special effects. The Amiga's video I/O and

The most basic desktop-produced video starts with live material (top left), blends in computer graphics (which either share the frame with the live video or use the entire screen) (top right), and then brings together all the various pieces through editing (bottom right).

nearly everything else is handled by a NewTek Video Toaster. The Toaster has most of the same capabilities the Truevision boards have, but the Toaster has custom chips on-board that perform dazzling digital special effects and other functions.

The figure shows the lab's video setup more clearly. There's more to the picture than this, and I will go into more detail in future articles. I plan to introduce you to the various products in the lab as they come into use.

Making the First Connection

Video I/O boards (actually a misnomer, because these boards do much more than just process video) like the Truevision NuVista+ and ATVista let you mix computer graphics and incoming video in just about any way you can imagine. These boards, however, do not drive the main display of your computer system—that is, the display on which program interfaces appear.

That's because a recordable video signal, thanks to its use of interlacing and its reduced resolution, makes a poor carrier for complex user interfaces.

The Mac in the Multimedia Lab uses an 8•24 GC card to drive its interface display, while the PC uses a standard VGA adapter. The Amiga uses three displays (the third is for the "preview" signal, described later). But when the Video Toaster is in use, all the displays flicker because the Amiga can synchronize its on-board video controller to an external signal (a process called *genlocking*), and the Video Toaster asks it to do that. As a result, the Amiga's interface display flickers when the Toaster is being used, but the Toaster software adapts its interface appropriately.

Using two (or three) monitors on your system may seem redundant and wasteful, but it has a distinct advantage: The separate interface display lets applications interact with you using

Avis features GM cars. Buick Regal.

Discover the Avis Corporate Account Program. Because small businesses deserve large perks.

Small, growing businesses like yours deserve the kind of benefits that used to be reserved only for big business. That's why we've created the Avis Corporate Account Program.

Sign up and the savings begin. It doesn't cost anything to enroll in the program, not even a registration fee. As soon as you enroll, we'll assign an Account Representative and a unique Avis Worldwide Discount (AWD) number to help assure that everyone in your company will start getting economical corporate rates.

Get 5 Upgrade Certificates – Free! Just for signing up now, you'll get 5 free Upgrade Certificates. These entitle your company's travelers to a car from the next-higher car group than the one reserved at participating U.S. locations. But the low corporate rate stays the same.

5 Free Upgrades

AVIS
We try harder.®

The more you rent, the more you save with the Avis Corporate Awards Program. Based on rental activity using your AWD number, we'll send you free Rental Day Certificates. And check your monthly statements for a variety of money-saving bonuses.

We'll even help with your bookkeeping. As part of the Avis Corporate Awards Program, you'll receive a detailed monthly statement outlining all qualified rental activity – including renters' names, rental dates, locations and more. So you'll spend less time on paperwork and more on helping your business grow.

Plus, other Avis services like Avis Express® and Roving Rapid Return® can save precious time for you and your travelers. **Call Avis at 1-800-321-3709, Operator 54**, for more details. Or send in the coupon below and sign up today. It's the best way to get the big perks your small business deserves.

all the screen space they need, without worrying about getting out of the way when it's time to record. And since the second monitor is typically for the signal being sent to your recording VCR, you can use a single monitor to view both the live, recordable computer output and the playback of the videotaped result. Some applications, however, require the broader color range of the video I/O board for their interfaces.

While it's often worthwhile to create a computer graphic and record it to tape, it's much more valuable to combine computer-generated graphics with external video. Take, for example, the image in the screen on page 110. The background image of a person working on a piece of manufacturing machinery came from a videotape that was shot with a camcorder. I hooked the video output from the AG-7650 video player to the video input on the Mac's NuVista+ board. I then used a presentation graphics package to construct the text and graphics, leaving the background a solid color. Next, I used AT&T Graphics Software Labs' StudioMaster Pro software to turn the graphic into an overlay by selecting the graphic's background as the *key color*. StudioMaster Pro moved the playback tape into position, loaded the graphics file, and switched on the NuVista+'s video overlay. The key color becomes transparent, so the video on the NuVista+'s input appears wherever the key color (the background, in this case) is painted. The combined image—video input plus computer-generated graphics—appears on the NuVista+'s video output, suitable for recording to tape.

This entire exercise took about a minute to complete, and it wouldn't have been much more difficult on the PC or the Amiga. This bird's-eye view of a titling exercise is only for illus-

tration, but it should start you thinking. Any system that does video overlay (including inexpensive systems like external Amiga genlocks and specialized VGA cards for PCs) is generally capable of combining computer graphics and video in whatever way you like, provided the video fills the entire screen. Nearly all video input cards also allow you to capture an incoming video signal, freeze it, and store the frozen image as a file for use elsewhere. The combination of moving video, captured images, and computer-generated graphics is a powerful one, as you'll see. But for now, I will digress and put a couple of thorny issues to rest.

The Great Format Wars

It would save a lot of time if you could take the video side of desktop video for granted, but you can't. The gear required to do the job properly can't be found in a department store or even in most video specialty stores. The equipment I selected for the lab, based on criteria I think most desktop video producers would use, falls into the industrial and "prosumer" classes I described earlier. What sets these units apart from consumer equipment are cost, quality, and computer controllability.

There are a number of standards for methods of recording video on tape. These are referred to as *video formats*, and there are more of them than you can imagine. But if you limit your scope to the formats that are affordable to people less well-off than Ted Turner, some cost/capability isobars begin to emerge.

Closest to the average desktop video producer's comfort zone lie two relatively new video formats: Super VHS (S-VHS) and high-band 8 mm (Hi8). As their names suggest, both are improvements

The Ultimate True-Color Image Presentation Tool For Windows™

Presentation Power

- Full 16-bit and 24-bit support, with optimized palette color compression on 256-color systems
- Attention-grabbing transitions between images: tile, louvre, wipe and snap with control over direction, style and display speed
- Ultra fast loading of BMP, TIF, PCX, GIF, Targa(TGA, VST) and other formats
- Portable presentation generation: one file contains the entire runnable show — copyright free!
- Speaker notes: print your notes and images
- File conversion: save any image as a Windows bitmap
- ImageQ Viewer (sold separately): can be controlled by your application through Windows DDE

Ease Of Use

- Slide sorting by name or visual matrix
- Automatic, multiple visual image directories
- Preview window for full size image display
- Cut and paste of text, graphics and images from any other Windows application that supports the clipboard

Presentation Control Language

- Full multi-media support at the MCI string level
- Control of image sequence with keyboard and mouse
- Define "click-on" regions in your image for even greater flow control
- Looping, conditional branching, random image access
- Adjustable run level adapts presentation to audience

How much longer can you afford to wait?

Create Overlaid Programs-Fast.

BLINKER™, the world's first and fastest dynamic overlay linker, reduces your link time to seconds and reduces program memory requirements. Now you can use one linker for all your software projects.

One Linker, Many Languages.

BLINKER 2.0 links and automatically overlays DOS programs written in Microsoft® C, BASIC, Assembler, QuickBASIC™, Fortran, Pascal, Watcom™ C, Zortech® C++, Clipper®, FORCE® and in Borland® C, C++, Assembler, and more.

Save Time and Memory.

BLINKER removes the need for overlay structures, simplifies program design and reduces memory requirements to save you time, effort and memory.

Memory Swap Function.

BLINKER is the ONLY linker to offer an integrated memory swap function, so you can run other large programs from within your program, with negligible memory overhead.

BLINKER™
High Performance Dynamic Overlay Linker

Don't Settle for Less.

Other major features include full CodeView® support, use of EMS/XMS at program run time, and enhanced execution speed of overlaid code.

Time is Money.

BLINKER offers all this in a fraction of the time it takes to link with your current overlay linker. You know time is money, and link time is no exception.

over the existing VHS and 8-mm formats. At a minimum, these improvements increase the resolution of the basic formats, but most S-VHS and Hi8 decks also employ other image-quality enhancements.

Even though these two standards deliver roughly the same image quality and call for similar levels of investment, they are at odds with each other. Just as in the VHS-versus-Beta wars of old, proponents of S-VHS and Hi8 are battling for the same audience. In my view, it shouldn't be so; the Multimedia Lab incorporates both formats into its work, and I couldn't imagine it any other way. Hi8 is attractive because of its mix of high quality and light weight. My Canon A1 Digital camcorder weighs less than 4 pounds—battery, tape, and all—and it's considered a heavyweight among midrange Hi8 camcorders. It travels well, and despite its birdlike physical attributes, it doesn't skimp on features or quality.

Hi8 suffers, however, from the very things that make it so appealing. Because the tape is so compact, the video heads have less surface area on which to "spread out" their signal. Dropouts (i.e., image degradation caused by flaking of the tape's magnetic coating) are common after several plays and tend to be much more noticeable than on larger formats. Some Hi8 tapes are less susceptible to dropouts than others, but in general, Hi8 is not durable enough for the thrashing that tapes get in a typical editing session. For gathering material, however, Hi8 is perfect.

An S-VHS tape weighs a ton by comparison. S-VHS tapes and gear are not nearly as easy to carry and use as Hi8. But S-VHS has proven, in my experience, to be equal to the demanding re-

quirements of editing and multiple plays. A number of highly capable professional S-VHS video decks have been released recently, and these units are, in all ways except cost and image quality, the equal of broadcast decks costing much more. It's a fringe benefit that these decks are also capable of recording and playing standard VHS tapes; there's no need for a specialized VHS mastering deck.

The equipment mix I finally settled on for the Multimedia Lab takes advantage of the best attributes of both formats. All the live video is collected using Hi8 camcorders and then is transferred to S-VHS for editing. Animations and other strictly computer-generated material are sent directly to the AG-7750, which has frame-accurate computer control and other attributes that I will describe later.

Segue Alert

Now that you understand some of the basics, it's time to take a breather until the next article in this series. There, you'll begin doing some *real* work, pulling together the raw materials that are part of a typical desktop video production.

You'll learn more about live video acquisition, film transfers, video capture, and image enhancement. I'll discuss the products and techniques used to acquire and shape these materials, which can later be combined to form finished productions. ■

Tom Yager is the director of the BYTE Multimedia Lab. You can reach him on BIX as "tyager" or on Internet as tyager@bytepb.byte.com.

Users**

Hauppauge!

Hauppauge PC's

Designed by Hauppauge

You've been using our Hauppauge MotherBoards for years. Now, you'll love our new computer systems. Designed by our engineers and built in the U.S., they're for Windows users like you who need more performance at an affordable price.

Our new 486M PC's use the Hauppauge Modular local-bus MotherBoards, while the 386N PC's use the famous Hauppauge SmorgasBord. We've made our GUIacc standard and provide generous cache

RAM and high-speed system RAM, features other companies call options. Your favorite Windows applications will run like never before. For the best PC values; buy Hauppauge Direct!

All Hauppauge Windows PC's include:

- Microsoft DOS 5.0
- Microsoft Windows
- MS mouse - two button
- Factory installed software on hard disk, with floppy disk backups. We scan all disks for computer virus's before shipping.
- 30-day satisfaction guarantee
- One year warantee with lifetime free labor
- Unlimited technical support

MICROSOFT
WINDOWS
READY-TO-RUN

33MHz 486M PC \$2,595

Modular local-bus PC

- Intel 33MHz 486DX, upgradeable to 50MHz +
- 128KB cache, expandable to 1MB
- 4MB RAM, expandable to 64MB
- 130MB < 16MSEC cached IDE disk drive
- Local bus GUIacc with 1MB video RAM
- 14" super VGA monitor
- 1.2MB, 1.44MB floppy drives
- 2 serial, 1 parallel port
- Maxiswitch 101 keyboard

33MHz 386N PC \$1,995

Next generation 386 PC

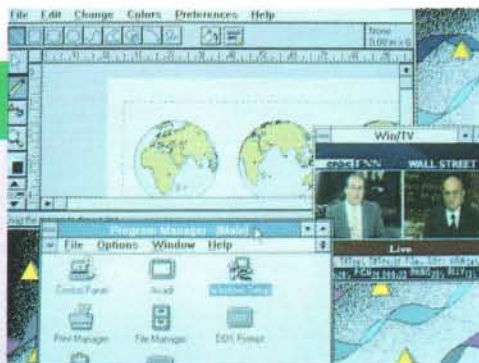

- 128K cache memory, expandable to 256K
- 4MB RAM, expandable to 32MB
- 130MB < 16msec cached IDE disk drive
- GUIacc with 1MB of video RAM
- 14" Super VGA monitor
- 1.2, 1.44 MB floppy drives
- 2 serial, 1 parallel port
- Maxiswitch 101 keyboard

for Power Windows.

Win/TV \$495

Watch TV in Windows!

Watch your favorite TV show while running your Windows application. Then, grab a video image and store it in BMP, TIF, TGA, or MMP format. Drop the image into any word processing, desktop publishing or paint program to bring your document to life!

- Movable, resizable TV window
- Channel tuner for connection to cable TV
- 2 external video sources let you watch video from a VCR or camcorder.

GUIlacc \$495

Make Your Windows Graphics Go Faster!

Our Graphic User Interface Accelerator, based on the S3 chip, will blow the doors off Windows!

- Accelerates Windows graphics up to 5 times faster
- Supports Windows resolutions from 640x480 to 1024x768
- Includes 1MByte of high-speed Video RAM
- Based on the S3 graphics coprocessor

Includes Norton Desktop for Windows

Buy any of our PCs for Windows and get a free copy of Norton Desktop, featuring Windows utilities, backup and data recovery tools.

\$149 Value

**THE NORTON
DESKTOP
FOR WINDOWS**

Who is Hauppauge?

In 1982, two former Intel engineers founded Hauppauge Computer Works to develop ways to make PCs run faster, better and longer. Over the years, our industry-first 386 and 486 Motherboards have been used by some of the largest PC and minicomputer companies in the world. And we've earned design and performance accolades including PC Magazine's "Editor's Choice" and PC World's "Upgrade Product of the Year."

Now, in 1992, our new division, Hauppauge Direct, brings you complete PC systems. We've designed them to be faster, more reliable and more cost-effective than the biggest names in the PC business. Whether you use our PCs for business or home use, education or research, you'll find they raise the performance level of all your applications.

When you buy a Hauppauge PC, you get unlimited technical support free of charge. Call us for more information today:

PCs For Professionals

33MHz 4860 CADstation \$6,995

(Autodesk AutoCAD
and RGB monitor
not included)

Our 4860 CADstation is designed for specific, heavy-duty applications. We've packed it with both a 33MHz 486 processor for fast overall performance and an Intel i860 RISC accelerator to speed up AutoCAD® and 3D-Studio®. And you'll get our 1152x900 24 bit-per-pixel local bus frame buffer for high speed photo realistic drawings. Dual monitor support plus the Hauppauge GUIacc top off the feature list to make the 4860 CAD station the world's best PC for CAD!

- i486 33MHz processor
- i860 RISC processor
- 16 MBytes 64-bit main memory
- 200 MB EISA SCSI disk drive and controller
- 1.4, 1.2 MByte floppy disk drive
- FrameBuffer: 24-bits-per-pixel, 1152x900 pixels, local-bus, RGB output

- ADI/860 for AutoCAD refill and 3D-Studio
- Demo copy of CadART/860 photo realistic renderer
- GUIacc with 1MB RAM
- 14" Super VGA monitor
- 2 serial, 1 parallel port
- Maxiswitch 101 keyboard, MS mouse

Rendered using CadART/860 on AutoCAD DXF file

Windows Goes Real Time

The iRMX for Windows operating system provides the best of both worlds:
real-time and DOS/Windows applications together on a single PC

KRISHNAN RAJAMANI, NARJALA BHASKER, RICK GERBER, AND STEVE SNYDER

Real-time applications have long been the domain of expensive proprietary hardware. But the relatively low cost of personal computers, the range of GUIs they can support, and the variety of software packages available for them make small systems an attractive alternative. The question is, can real time on personal computers work with acceptable response times and without losing access to popular DOS and Windows applications?

DOS certainly does not provide the bed for the multitasking necessary for real-time applications; nor does it provide adequate run-time support for them. TSR programs provide only a semblance of multitasking. Even Windows doesn't provide the preemptive priority-based multitasking that sophisticated real-time applications need.

Equally important, neither DOS nor Windows guarantees a bounded interrupt-response time (i.e., the time that elapses from when an interrupt occurs to when its interrupt handler starts to execute). Historically, proprietary kernels (i.e., operating systems) have provided the bounded interrupt latency, deterministic task-switch time, and other features that real-time applications need.

However, completely abandoning DOS and Windows in favor of a proprietary real-time kernel is not attractive, either. Such a solution forsakes the wealth of GUI, data-analysis, and display packages that are available under DOS and Windows. Without these packages, it's hard for real-time applications to meet the expectations of personal computer users. "Reinventing the wheel" on proprietary kernels also is not cost-effective.

Systems designed to support real-time applications must respond to external asynchronous events within a predictable time frame. Whereas *real time* is often interpreted to mean *fast*, a better synonym would be *predictable* or *deterministic*. The technology inherent in making a system real-time can add significant benefits to any application

that requires a predictable response time. Real-time systems must support asynchronous I/O to maximize predictability. This support goes further than just making I/O fast; it enables a system to concurrently execute other portions of an application during I/O.

Intel's iRMX for Windows operating system forms a bridge between DOS/Windows and real time. (Note: We use the term DOS/Windows here to imply either DOS alone or DOS and Windows together.) This operating system runs DOS/Windows as a single task under the iRMX (for real-time multitasking executive) 32-bit protected-mode operating system. It allows you to use the capabilities of iRMX with the Windows GUI to develop real-time applications supporting a wide

range of configurations, from single CPU systems to multiprocessor systems based on networks or Multibus II. (For more information on iRMX for Windows, call (800) 438-4769.)

In the past, the iRMX family of operating systems was focused on either component-level applications or applications using Multibus. (For more information on the characteristics of the iRMX operating system, see the text box "Exploring the iRMX Pedigree" on page 122.) With the advent of iRMX for Windows, iRMX has been unbundled from such proprietary hardware. iRMX for Windows will run on any IBM- or Compaq-compatible 386 or 486 machine.

The extended features of the 386 architecture, such as V86 mode, multiring protection, and multiple address spaces, make the marriage between DOS/Windows and iRMX possible. (Note that the term iRMX by itself refers to the non-DOS/Windows aspect of iRMX for Windows.)

A Real-Time Windows Application

Picture a hypothetical control system, say a luggage-tag engraver, running on a personal computer. The luggage tags sit in three bins, each bin containing different colored tags. For each engraving request, a tag is retrieved from the appropriate bin and placed on a conveyor. The conveyor moves the tag to an engraving station where a robotic arm moves it to an engraver. A vacuum pump activates to hold the tag in place and clean the station of engraving debris. The engraver activates and engraves the tag. When the engraving is complete, the robotic arm places the tag back on the conveyor, which moves it to a collection point.

The upper section of figure 1 shows the real-time components of such an application. Typically, they consist of control tasks of varying priorities and, perhaps, some hardware interrupt handlers. Together, these tasks and interrupt handlers control and respond to hardware events in a timely manner.

Imagine that a Windows screen (e.g., an Excel window performing order entry for the system, a custom window displaying a graphical representation of the control system replete with moving parts, a soft-control panel, and so forth, illustrated at the bottom of figure 1) conceals the control system illustrated at the top of the figure. Now picture a PC simultaneously running the control system with the user interface at the bottom of the figure. iRMX for Windows lets you do that.

Figure 1 shows how the iRMX nucleus schedules DOS/

Windows and its applications as a task along with the other real-time control tasks. (You would probably want to set the priority of the control tasks higher than that of the DOS/Windows task.) The control tasks communicate not only among themselves, but also with DOS/Windows applications through a variety of interfaces.

Under iRMX, Windows can run in real or standard mode. Since iRMX applications can install 32-bit interrupt handlers at Ring 0 (the most privileged execution state on an Intel processor, and the state

where operating-system kernels normally run), they get control directly, regardless of the processor mode, with a bounded latency.

A Multitude of APIs

Since iRMX for Windows merges different operating systems, it contains a rich set of application programming interfaces. An application may not need all of them, but their availability provides flexibility. The APIs fall into three categories: native iRMX APIs for iRMX tasks, native DOS and Windows APIs for DOS/Windows programs, and Bridge APIs that allow DOS/Windows programs to communicate and synchronize with iRMX tasks.

The iRMX APIs include system calls that support preemptive priority-based multitasking, interrupt management, exception handling, 32-bit memory management, and intertask communication, synchronization, and mutual exclusion. These APIs also provide device-independent I/O and network access.

DOS and Windows provide the native DOS and Windows APIs. Since DOS and Windows actually coexist with iRMX, the full range of native DOS APIs is available. Windows is optional, and its associated APIs are available if you load it.

The typical application envisioned for iRMX for Windows includes the interaction of real-time components; of user-interface and non-real-time components; and of real-time components and non-real-time components, including the user interface. With these functions in mind, you would use iRMX APIs to implement the real-time components of the application; DOS/Windows APIs to run the user-interface and non-real-time applications, such as a spreadsheet; and the Bridge APIs to bridge between the real-time components and the user-interface components.

Bridge APIs

The Bridge APIs come in three forms: real-time extensions, network interfaces, and Dynamic Data Exchange. The RTEs provide a critical subset of iRMX services—including semaphores and mailboxes—to DOS/Windows programs. A DOS/Windows program can use these primitives just as any other iRMX task would. The standard networking interface lets DOS/Windows programs use the NetBIOS interface to talk to iRMX tasks. Windows provides the DDE mechanism for programmatic communications between applications. Many popular applications, including Excel, Intouch, Visual Basic, and Toolbook, support DDE largely to implement the notion of links between documents. DDE is therefore the key to providing iRMX applications with the ability to communicate with standard Windows applications.

The DDE communications model considers each application to have a set of data items named by strings. Each application defines the format and meaning of data-item names (e.g., Excel requires that data items referring to cells use RnCn notation). Data items are located using an address with three elements: the application name, the topic name, and the data-item name.

The topic name distinguishes among multiple application instances. For example, with two instances of Excel active, the DDE mechanism uses the name of the file that each instance is running to distinguish between them.

Applications can set and query data items owned by each other. They can also ask to be notified if a data item's value changes for event-driven operation. An application that actively makes DDE requests is called a *DDE client*. An application that passively responds to them is called a *DDE server*.

DDE support in iRMX for Windows consists of two elements: a DDE Library to enable iRMX applications to participate in DDE communications, and a DDE Router Windows program that converts them to network communications. The DDE Library contains simple calls that iRMX DDE clients use to set and reset

BYTE ACTION SUMMARY

Combining real-time applications with the relatively low cost of personal computers, the range of GUIs they can support, and the variety of software packages available for them is an exciting new development. Accessing DOS and Windows capabilities in a real-time environment provides the best of both worlds.

Mathematica 2.0: the standard for technical computing

"The importance of the program cannot be overlooked ... it so fundamentally alters the mechanics of mathematics."

New York Times

"Mathematica has the potential to change the world of science at least as much as word processing has changed the world of writing."

InfoWorld

"Mathematica is a startlingly good tool."

Nature

Mathematica has also received best software/new product awards from:

Macworld, 1990-91

Discover, 1990

BYTE, 1989

MacUser, 1989

Business Week, 1988

InfoWorld, 1988

Available across PC, Macintosh, Unix, and VMS platforms, *Mathematica* includes a full range of interactive numerical, graphical, and symbolic computation capabilities, all linked to the powerful built-in *Mathematica* language. *Mathematica* 2.0 adds still more features to the proven leader in technical computing software, including sound generation and flexible external program communication.

Mathematica has rapidly become the standard for technical computing, with more than a dozen textbooks, a quarterly journal, and several newsletters devoted to the system. *Mathematica* is in use at all of the 50 largest U.S. universities, all of the technical Fortune 50 companies, and most of the world's larger engineering firms. In fact, more than 100,000 technical professionals and students around the world are working with *Mathematica* every day.

To find out what *Mathematica* can do for you, call Wolfram Research at 1-800-441-MATH.

Exploring the iRMX Pedigree

The iRMX family of real-time operating systems has been on the market for more than 13 years. It is widely used in such mission-critical applications as check and mail sorting using high-speed imaging, medical instrumentation, machine and process control, satellite communications, energy management, financial trader workstations, and Automatic Teller Machines.

The basis of the new iRMX for Windows operating system is iRMX III. The new system is a true 32-bit multitasking operating system with real-time programming facilities, including the following:

- Preemptive, priority-based task scheduling with optional round-robin (or time-slice) scheduling within a priority level.
- Advanced interrupt-management facilities that provide a deterministic response to asynchronous external events.
- Efficient memory management with 4 gigabytes of memory accessibility.
- Multiple intertask communication and mutual-exclusion mechanisms to provide optimum task cooperation.
- Full integration with the protection mechanisms of the 386 architecture for clean-code enforcement and program isolation.
- An extensible set of system objects with built-in type checking for increased programming clarity.

The iRMX model for program iso-

lation is an object called a *job*. A job defines the environment for a program and contains all the resources that its various components use. Each job has its own memory segments. Its resources are by default private but can be made public, if desired, so other jobs can use them.

A job can have multiple threads of execution, each of which is called a *task*. Tasks are the active objects within a job. Each task has its priority specified when it is created.

Tasks progress through a number of action states while they exist, between running (in control of the CPU), ready (preempted by a higher-priority task), and delayed (waiting for an event). Tasks communicate with each other through system calls, which include the following:

- `send_message` lets a task send system objects, such as segments, to object mailboxes.
- `receive_message` lets a task receive system objects, such as segments, at object mailboxes.
- `send_data` lets a task send data to data mailboxes.
- `receive_data` lets a task receive data at data mailboxes.
- `send_units` lets a task send several abstract counting units to a semaphore.
- `receive_units` lets a task receive several abstract counting units from a semaphore.
- `catalog_object` allows a task to catalog the name of a mailbox or semaphore in a job's object directory

so that other tasks can look it up by name and use it for intertask communications.

- `lookup_object` lets a task look up the name of a mailbox or semaphore in a job's object directory and use these exchanges for intertask communications.
- `signal_interrupt` lets an interrupt handler `signal` an interrupt task to provide additional processing for an interrupt—processing that the interrupt handler itself cannot provide.
- `wait_interrupt` lets an interrupt task wait for an interrupt that needs special processing.

Task priorities and these intertask communications mechanisms provide all the tools necessary to meet the real-time requirements of even the most demanding applications. Other calls allow the creation and deletion of these various exchanges, as well as the removal of objects from object directories. The various receive calls have time limits associated with them, so tasks that use them may be blocked (or delayed) until the requested information is received.

Other system calls also exist and provide management for memory, objects, exception handlers, interrupts, files (including device-independent I/O), and operator interfaces. The iRMX III operating system also allows you to define new object types and produce new system calls to manipulate objects of these new types. Such extensibility provides a great deal of flexibility.

data items in DDE servers. It also provides calls that iRMX DDE servers use to advertise data-item or topic names and register handlers to invoke when requests arrive for any data item.

The DDE Library communicates with the DDE Router using a simple applications protocol built with standard network interfaces. This protocol extends DDE addressing by adding the network name of the machine. So a DDE address has four components: a machine name, an application name, a topic name, and a data-item name. Both polled and event-driven operations are possible for iRMX applications.

Of the Bridge APIs, RTE is more efficient than the network interface or DDE, but it is not natural for DOS/Windows programmers. NetBIOS and DDE are more familiar. In fact, many Windows software packages already support data manipulation

via DDE. So, it may be more convenient for iRMX tasks to communicate with those packages in that way.

Using NetBIOS or DDE to communicate between DOS and iRMX has another subtle advantage. NetBIOS and DDE lend themselves to transparently distributing the real-time and user-interface components across multiple machines. The user interface and non-real-time components could execute on one machine while the real-time elements execute on another. Communications between the components could then occur over the network.

However, you don't need network hardware if the entire application resides on a single PC. The networking interfaces work transparently whether short-circuited on one machine or dispersed across several systems. Similarly, the network-based DDE Router provides transparent scalability for the DDE interface.

continued

About the only thing Superbase 4 can't contain is your imagination.

Imagine this.
A Windows™ database that can handle virtually any data type.

It's called Superbase® 4 from Software Publishing Corporation. With it, the development possibilities are, well, thought provoking.

Consider bar coding. Think creatively and anything's fair game. One high-security prison, for example, uses Superbase 4 to keep track of their prisoners.

Or how about video?

Through DLL you can store still shots from a full-motion video camera. Or grab key images from a previously recorded tape.

What's more, any photographic or graphic image can be included in any data file. So you can dress up product

catalogs. Personnel records. You name it.

And through DDE you can even pull in everyday business accessories. Like maps, graphs, charts, and spreadsheets.

But this versatility doesn't come at the expense of power. Superbase 4 is fast. It lets you include an unlimited number of characters in any text field. And supporting SQL, it connects with some formidable

databases—SQL Server, Oracle, Sybase, dBase, and DB2, among others.

In fact, Superbase 4 already manages a direct mail database containing over one million records. It could handle a lot more.

So it's no wonder Superbase 4 is the worldwide market leader in Windows databases.

Just imagine what it can do for you.

Imagine, a free demo disk just by calling 1-800-336-8360, Operator 626.

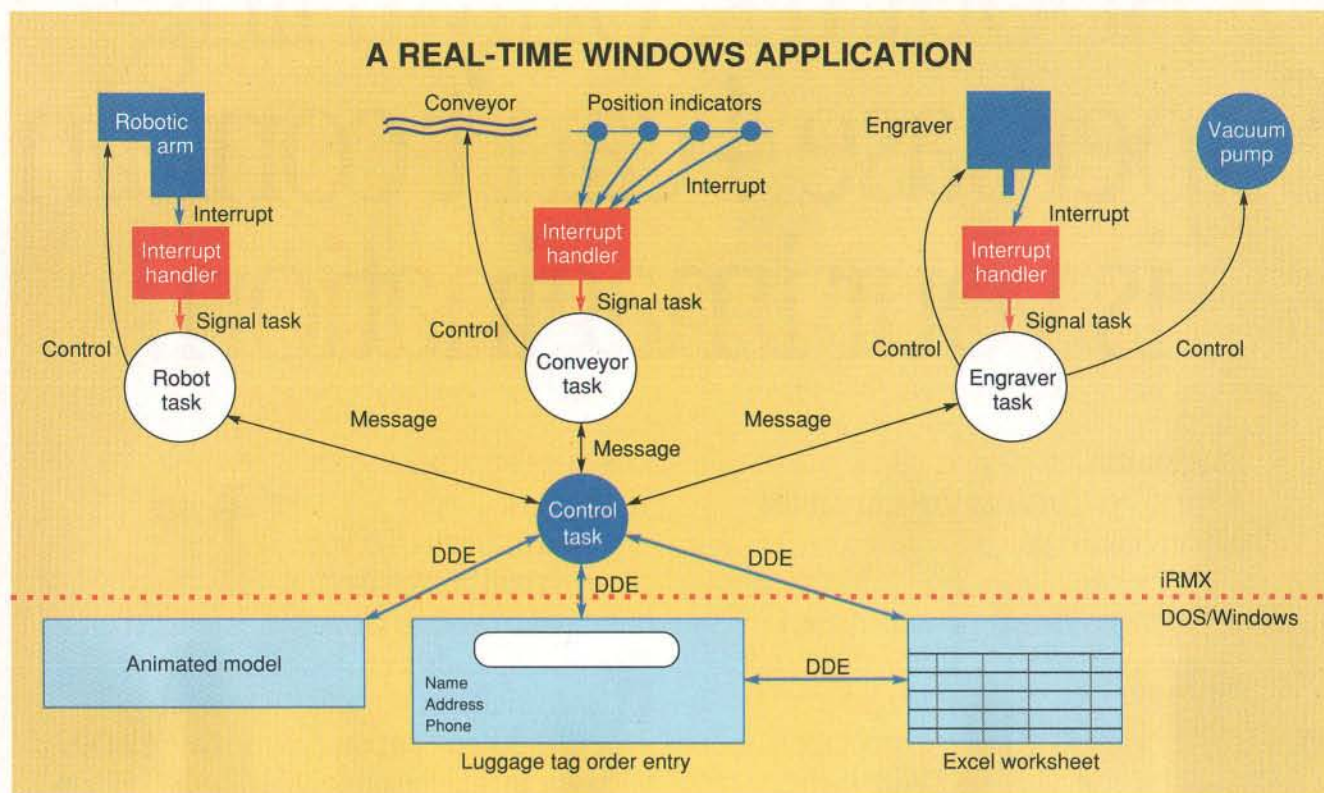

Figure 1: The top part of the figure details the real-time components of a luggage-tag engraving application, including control tasks and hardware interrupt handlers. The bottom part shows a Windows screen (e.g., an Excel window for order entry, a custom window showing the control system graphically, and a soft-control panel), which might conceal the control system at the top. The iRMX for Windows operating system establishes the linkages to accomplish this on a PC.

File Systems and Other Devices

Under iRMX for Windows, DOS and Windows programs continue to access I/O peripherals and the DOS file system as usual. They can also access remote file systems through any of the available network products (e.g., NetWare and MS-Net). Other iRMX tasks can access these file systems simultaneously via native iRMX I/O APIs. Here, iRMX requests are internally translated into DOS service requests.

Optionally, iRMX also provides a native iRMX file system that can reside on a separate disk, co-reside with the DOS file system on a partitioned volume, or exist elsewhere on the network. However, iRMX tasks use the same iRMX APIs to access either the DOS or the iRMX file system.

DOS programs can also map drive letters to iRMX file systems and access the iRMX files via the usual DOS I/O APIs. In this case, requests are internally translated into iRMX service requests.

A special iRMX for Windows API allows iRMX tasks to invoke real-mode software interrupts. Thus, the tasks can directly access special DOS device drivers as well as standard DOS or ROM BIOS services.

Remote file sharing includes both client and server capabilities. Since the DOS file system is visible to iRMX, a system running iRMX for Windows can enable remote clients to access the DOS file system while simultaneously allowing DOS/Windows and iRMX tasks to access remote servers. And since remote file systems are also visible to iRMX, that same system can act as a gateway for clients that can't access them directly. For example, an MS-Net client could access a Novell server in this environment.

iRMX for Windows also provides ISO transport services to

iRMX tasks via Intel's PCL2A Ethernet controller. A network redirector subsystem allows NetBIOS applications from DOS/Windows to share that controller. DOS/Windows programs can also access a wide variety of other network hardware and software.

Under iRMX, applications can dynamically install new device drivers at run time. These drivers have a well-defined interface to the iRMX I/O system. Applications access them via device-independent APIs and through special driver-specific APIs.

The device drivers in iRMX for Windows run at Ring 0. The associated interrupt handlers obtain control directly, regardless of processor mode. This not only improves interrupt latency for device drivers, but also removes the burden of installing dual-mode interrupt handlers. Under iRMX for Windows, applications can also install operating-system extensions to define new APIs and even new object types at run time.

The Inside Story

To establish DOS as an iRMX task, you first boot DOS and load a special iRMX TSR, which reserves a small portion of conventional memory for iRMX. Next, the iRMX for Windows loader puts iRMX in extended memory, where it takes control of the CPU in protected mode and initializes each of the operating system's internal layers and system tasks.

This initialization creates a special system task and dispatches it in V86 mode to the loader's return address. Then the loader cleans itself up and returns to COMMAND.COM, which resumes the DOS idle loop. DOS is now set up as an iRMX task, and all subsequent DOS programs will execute in this context

Close-Up Wins Remote Honors

Close-Up is fast, easy to use, and reliable. What else do you need in a remote package?

Close-Up Dual Pack 4.0 earns its Best Buy by virtue of lightning speed, an easy interface, reliable error handling, and a complete set of tools for controlling one computer from another and collaborating with a partner. It's also the only package that can run Windows reliably from afar—even in extended mode. Runner-up **Remote2** isn't quite as fast, and its toolbox is smaller, but it is perfectly dependable with graphics.

"Close-Up...The Best Program You Can Buy for Remote Control"

—Reprinted from PC Magazine, January 14, 1992

The Ultimate Remote Program
"Norton-Lambert's Close-Up is the fastest, easiest, and the most reliable program we looked at..."
 —PC World, February 1992

The results are in and the experts agree. New Close-Up 4.0 has proven time and again to be the most advanced remote control system available.

Close-Up lets you view & control PCs miles away by modem. Now with full support for Windows, DOS, graphics and mice at record-breaking speeds, Close-Up is the fastest, easiest way to handle all your remote communications needs.

What You Can Do:

- ✓ Take control of PCs at any location.
- ✓ Work remotely on the road via laptop.
- ✓ Control your office PC from home.
- ✓ Access your company's branch offices.
- ✓ Train your associates on any application.
- ✓ Help customers miles away, remotely.
- ✓ Transfer text, data, any file between PCs.
- ✓ Remotely install and run Windows.
- ✓ Automate remote operations at night.
- ✓ Access networks all over the world.

Winner of the Top Awards

"Close-Up has been highly polished and it's flexibility and capability clearly make it the best program you can buy for remote control."

—PC Magazine "Best of 1991," January 14, 1992

"If you're serious about going remote, check out Close-Up. The program's handling of Windows is simply dazzling."

—PC World "Best Buy," February 1992

"Close-Up is one of the fastest products we've seen. It had the fastest file transfer times and the shortest times redrawing the screens."

—LAN Times, November 18, 1991

"You will not find a better all-around remote-control program."

—PC Magazine "Editors' Choice," February 25, 1992

Control both Windows and DOS with just one program

Now with double the remote power, Close-Up gives you full support of both Windows and DOS. That's like getting two remote programs for the price of one!

Spectacular Savings!

Now you can receive the Close-Up 4.0 Dual Pack including both sides for only \$199—you save \$240!

Upgrade Now!

Upgrade your current remote program to new Close-Up 4.0. Call for special pricing.

Remote Performance:
 Why Close-Up is Best

- Supports both Windows and DOS with the same program.
- Fastest VGA, EGA and CGA graphics.
- Fastest file transfers and remote screens.
- Runs Windows in all 3 modes. No restrictions.
- Runs multiple Windows and DOS applications simultaneously, full-screen or windowed.
- Remote mouse and keyboard control.
- Self-installing, fully-automated for fast, easy operation.

NEW

Stand-Alone LCD Monitor

£699.00

This 10" black on white monitor is easy-to-read, yet compact. Resolution is 640x480 for sharp, flicker-free image. Sharp's high refresh rate, triple supertwist nematic technology with back lighting provides a super bright, low radiation screen with a wide viewing angle. The adjustable monitor base is only 29x14 cm. It lets you mount the LCD monitor on vertical surfaces or fold for transport. Comes with 1.5 m cable and VGA adaptor card. No external power required. IBM AT compatible.

Popular Space-Saver Keyboard

£99.00

First successful alternative to conventional keyboard saves 60% desk space with a foot print of 27.3 x 15.2 cm. Has full travel tactilily responsive keys with standard left-right spacing for easy touch typing. 100 keys, compatible with IBM XT/AT PS/2. Many language versions available.

9" VGA Monochrome Monitor

£189.00

640 x 480 resolution black on white screen with a foot print to match the Space-Saver Keyboard of only 25.0 x 25.7 cm. Tilt and swivel stand. No adaptor card included.

WINDOWS GOES REAL TIME

THE DOS/IRMX RELATIONSHIP

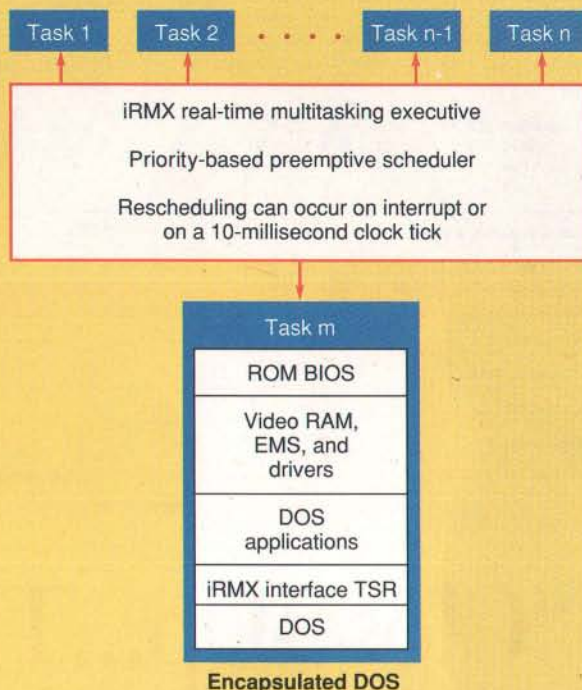

Figure 2: DOS runs as an iRMX task like any other in V86 mode. The DOS task contains a normal DOS system complete with drivers, ROM BIOS, and applications. In that same iRMX task, you can initiate Windows just as you would on a dedicated DOS system.

(see figure 2). Now you can start Windows from DOS, if you wish. It will run in the same iRMX task that DOS does.

An application's real-time components can be loaded as protected-mode iRMX jobs at any time, either automatically after system initialization or manually from the console. Several jobs can run in the background, and each can contain multiple tasks.

The iRMX kernel runs in protected mode at Ring 0, while DOS and real-mode Windows run in V86 mode. If you load Windows in standard mode, it runs in protected mode but at a less-privileged level than iRMX. iRMX owns the global descriptor table and interrupt descriptor table, as well as its own local descriptor table. Standard-mode Windows has a private LDT.

Initially, iRMX owns and manages all the extended memory. Standard-mode Windows obtains extended memory from an iRMX Extended Memory Specification driver. Windows is then responsible for managing its own extended memory. The XMS driver provides functionality similar to that of HIMEM.SYS. Figure 3 shows how DOS, Windows, and iRMX use system memory.

The iRMX kernel schedules native iRMX tasks along with the DOS/Windows task according to priority. iRMX switches the CPU between V86 mode and protected mode as required when switching between tasks or dispatching interrupt handlers.

Any task, including the DOS/Windows task, can take hardware interrupts. The system first traps those that DOS/Windows handles in Ring 0 and then reflects them to the appropriate real-mode handler or Windows protected-mode handler (see figure

Blockbuster Presentations

Businessman's Budget

Curtain Call™ Presents...
Titles, Effects, Backgrounds, Paint, Slide Show, Sound and Music for Windows.

Get Rave Reviews.
Produce top-of-the-line presentations or videos that look good on the bottom line. You've got to try Curtain Call.

Talent Not Needed.
Because Curtain Call provides the cast and crew, making spectacular images is now a breeze. Start by producing a rainbow of beautiful backgrounds with just a click of the mouse. Then transform any Windows fonts into dazzling titles with shadows, outlines, metallics and 3D extrusions. Add your own artistry with Curtain Call's full-featured

Dazzling Titles

and easy-to-use paint tools. Finish it off with pictures, text, graphs, or still-frame video imported from other programs through Curtain Call's clipboard.

It's Show Time.

Your images can be sequenced and controlled with the mouse or menu-driven script editor. Slick variable speed transition and overlay effects add lots of polish. Preview any portion of your show at any time. Synchronize voice, sound effects and music, through Sound Blaster or another PC sound board. It's a blast!

Dynamic Graphics

Curtain Going Up.

It doesn't take an M.B.A. to figure it out. What used to cost thousands can now be yours for under \$200.

Powerful Effects

Make Curtain Call your Windows presentation star and listen to the applause. Break a leg for \$199.95.

4). It also traps the return from these handlers to ensure that the interrupted task resumes execution in the appropriate CPU mode.

Similarly, the system traps all software interrupts from DOS/Windows programs and reflects them to the appropriate DOS/Windows handler. It also traps any attempt by Windows to switch the CPU between real and protected mode. iRMX for Windows performs any mode switching.

In addition to CPU sharing, iRMX shares other hardware resources with DOS and Windows. DOS and Windows can use the numerics coprocessor for floating-point instructions, as can iRMX applications, since iRMX maintains the numerics register context on a per-task basis. Both iRMX and DOS/Windows need the timer, so iRMX traps timer interrupts and reflects them to DOS or Windows at appropriate intervals. Also, iRMX and DOS/Windows can share hard and floppy drives. iRMX uses DOS APIs to access these resources. The iRMX TSR serves as a surrogate DOS process in whose context iRMX can obtain these services.

Remaining Predictable

Despite the presence of DOS/Windows and their applications, iRMX for Windows guarantees real-time response for critical iRMX tasks. First, the priority of a DOS/Windows task is low; it will run only when higher-priority tasks are idle. Higher-priority real-time tasks can preempt DOS/Windows tasks at any time.

Second, by using 386 protection features, iRMX traps any attempt to disable CPU interrupts from DOS or Windows. The actual CPU interrupt flag is always set to enable interrupts whenever DOS/Windows is running. However, iRMX maintains the DOS virtual state of this flag so that it won't reflect any hardware interrupts while DOS/Windows has disabled CPU interrupts. This ensures the integrity of DOS/Windows while it bounds the latency for iRMX hardware interrupts.

Third, iRMX traps DOS/Windows' I/O instructions that modify the interrupt masks of the programmable interrupt controller. The

WE CHANGED THE SHAPE OF COMPUTING...

We put the best features of your favorite computer into a keyboard.

Before KNS (Keyboard Network Station), when you purchased a computer system, the manufacturer threw-in the keyboard. Now, when you buy a KNS keyboard, we'll throw-in the computer.

And what a computer! Choose from 286 and 386SX models in a variety of CPU speeds. Specify up to 4MB of RAM. Your KNS comes standard with Super VGA adapter, 3.5" floppy disk drive, 2 serial ports, 1 parallel port and a 16-bit expansion slot—all housed in a lightweight, portable, AT-style keyboard.

A network interface card can be installed in the built-in 16-bit expansion slot; installation is quick and easy. And, KNS is compatible with most popular network operating systems.

We changed the shape of computing and the KNS will change the way you add workstations to your network.

WINDOWS GOES REAL TIME

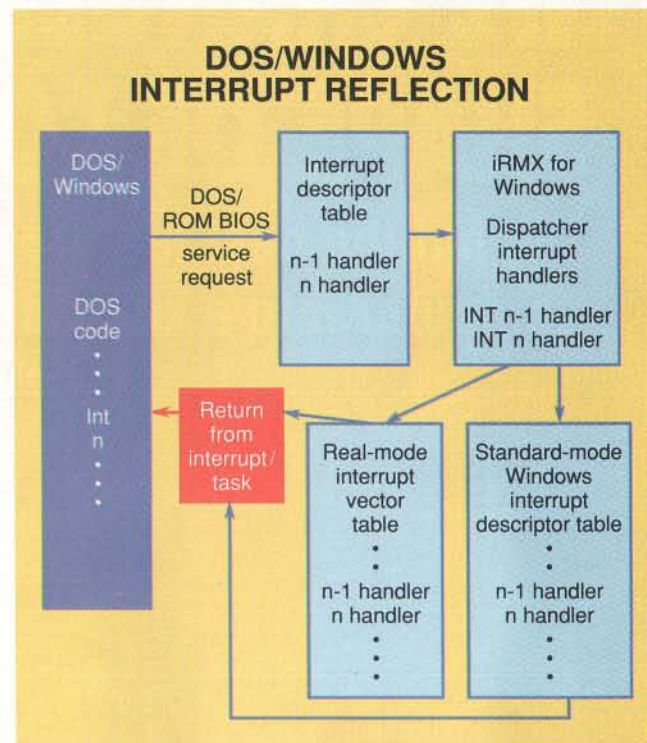

Figure 4: Any iRMX task, including DOS/Windows, can initiate hardware interrupts. The system traps DOS/Windows interrupts in Ring 0; reflects them to the appropriate handler, whether real-mode or protected-mode; and then traps the return to route the tasks to the appropriate mode.

operating system emulates PIC operations in such a way that DOS cannot change the mask for iRMX's interrupt levels. Each interrupt controller has two logical parts: iRMX owns one, and DOS/Windows owns the other.

Finally, iRMX ensures that tasks above a certain priority do not take DOS/Windows interrupts. Thus, an application task can guard itself from long interruptions, such as a long list of TSRs triggered by the timer.

Making Trades

Trade-offs occur in uniting iRMX and DOS/Windows. To preserve the determinism of iRMX-owned interrupts and high-priority tasks, DOS and Windows pay a performance penalty.

Similarly, to maximize the device independence of standard AT peripherals, iRMX does not access them directly, but uses DOS and the BIOS to do so. iRMX for Windows doesn't require special device drivers to access a drive or file system. An alternative would have been to emulate DOS file and other I/O services with higher-performance device drivers and file systems.

This marriage sacrifices the functionality of enhanced-mode Windows (e.g., virtual memory and multiple DOS sessions). But it supports the faster standard-mode Windows. Despite these trade-offs, however, iRMX for Windows brings real-time applications to the PC. More than that, it encourages their cohabitation with DOS/Windows applications, providing the best of both worlds. ■

Power Reading for Power Users

Read these in-depth Computing 'Know How' books

PC Intern - For the DOS Programmer

PC Intern is a completely revised and expanded edition of our bestselling *PC System Programming* book. It's a literal encyclopedia for the DOS programmer. If you program in assembly language, C, Pascal or BASIC, you'll find dozens of practical, parallel working examples in each of these languages. **PC Intern** clearly describes the technical aspects of programming under DOS. More than 1200 pages are devoted to making DOS programming easier, including:

- COM and EXE programs, the BIOS and services
- Writing device drivers, overview of ports and accessing them
- Interrupts, interrupt calls and their significance
- New and expanded appendices and much, much more

1200+ pages with 3 1/2" companion diskette.

DOS 5.0 Complete: Special Edition

It's the practical user's guide to learning Microsoft's new DOS and is loaded with helpful time-saving techniques. Contains dozens of easy-to-follow examples in a friendly, easy-to-understand writing style. From installing DOS 5.0 to using the new features for file, directory and storage maintenance, you'll find all you need to get the most from your computing sessions. Topics include:

- Using DOS' new memory management features
- Using EDIT, the new DOS 5.0 editor
- Using QBASIC, the new BASIC programming language
- Complete, comprehensive DOS command reference section and more

This *Special Edition* includes **Tempest**, the Intuitive Graphic Shell for DOS 5.0. **Tempest** provides a graphical program manager and Shell for all DOS computers, using pull-down menus, dialog boxes and windows. Whether you need to move files, rename directories or launch programs, **Tempest** is the answer to easier computing. 920 pages with 3 1/2" companion diskette.

KINDER, GENTLER COMPUTING

Natural I/O technologies make your computer work for you,
instead of the other way around

MAUREEN CAUDILL

It's April 1993, and you've just purchased a top-of-the-line personal computer from Big Apple. You open the box and begin to assemble it, but to your surprise, you don't see a keyboard, only a special pad and pen that resemble those in an executive portfolio. The box also contains clothing: a body suit, a pair of gloves, and a headband. You see no monitor, only a helmet and goggles. What's going on here?

What you're about to experience is your first taste of natural computing: making computers interact with users in a humanlike manner. Natural computing emphasizes how computers interface with humans on a sensory level rather than through the cognitive command logic today's devices use.

Natural computing intrinsically deals with human sensory perception. Neural networks, or processing systems modeled after the human brain, are particularly good at the low-level sensory tasks that digital computers find difficult to perform.

Natural input includes such technologies as speech and handwriting recognition and gesture interpretation. Natural output includes speech; meaningful, humanlike gestures and motions; and virtual-reality environments.

Natural I/O is the ultimate user-friendly interface. It places the burden of communication squarely on the computer rather than on the human: Instead of the user having to learn the computer's preferred interface, the computer must deal with the user's preferences. Although computers have been moving in the direction of natural I/O for years, the relevant enabling technologies are only now becoming mature enough to make this capability a reality in the immediate future.

Learning to Talk

Probably the first thing you thought of when you read the term *natural I/O* was a speech interface, so it's no surprise when you discover that your Big Apple system comes complete with a microphone and stereo sound. (Speech I/O is new; sound in general is not. Since 1990, systems such as the Next machine and the Macs have included sound capabilities as a part of their standard configurations.)

With natural-speech input, you face the two separate but

interdependent problems of speech-to-text conversion and natural-language processing (NLP). Natural-speech output technologies confront the problems involved in speech generation.

Some excellent systems use hybrid expert-network technology married with traditional digital signal processing (DSP) techniques. Because words and phonemes frequently require several fractions of a second to utter, the sonograms (visual patterns representing sound waves) for even discontinuous words represent very large, complex blocks of data. Also, because of variations in pitch, tone, accent, dialect, and pronunciation, computers have an extremely difficult time recognizing even simple words like *cat*. They can do it, however, under limited circumstances.

Any number of commercial products offer single-speaker, single-word voice-recognition capabilities with various levels of competence. A few can handle single-speaker continuous speech with a small vocabulary, and some can process multiple-speaker discontinuous speech with limited vocabularies. But very few can handle many speakers, continuous speech, and large vocabularies.

voice typewriter using a combination of all available technologies: DSP, rule-based systems, and neural networks. It's this blend of the traditional and the new that made it such a success.

Using the voice typewriter, you speak into a noise-canceling microphone. The sounds you make are digitized into a 12-bit Gray Code and are sampled every 10 milliseconds, and a Fourier transform (a mathematical technique that converts time-sampled data to the frequency domain) is applied. The transform, of course, discards phase information in the signal—a weakness in this preliminary design.

The frequency-smoothed logarithms of the transformed signals are reduced in dimension to normalized 15-element vectors. A series of vector-quantizing neural networks categorize these vectors into probable phoneme-text conversions. The main neural network handles simple conversions; specialized networks process more subtle distinctions (e.g., between the sounds of \k\, \p\, and \t\ separately). A rule-based expert system then corrects mistakes and handles contextual or coarticulation problems (a coarticulation effect is one where the pronunciation of a phoneme is affected by the previous or the following phonemes; see figure 1).

The voice typewriter has achieved some remarkable results. It was tested using the most extreme speech-to-text case: multiple speakers, continuous speech, and a large vocabulary. Although the first 100 or so words from each speaker were used as training data for the neural network, the system did not have to be trained on the complete vocabulary of each speaker—only on a representative sample of words.

Under these conditions, the voice typewriter achieved between 92 percent and 97 percent accuracy in converting speech to text. Further, it was able to type the text on a system monitor with a time delay of only about a quarter of a second.

These results are not quite good enough

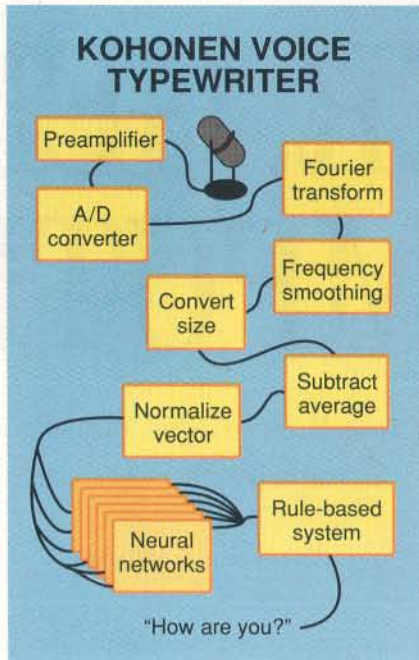

Figure 1: The Kohonen voice typewriter marries conventional digital signal processing with neural networks and rule-based experts to produce an excellent speech-to-text system that responds in about ¼ second with accuracy in the 92 percent to 97 percent range.

for widespread commercial use; the voice typewriter is a little too slow and inaccurate for the average user to accept. Nevertheless, this marriage of multiple technologies into a finely crafted solution provides strong clues to how future speech solutions may be constructed.

Say What You Mean

Although great strides have been made in speech-to-text conversions, the ability to convert sounds to characters doesn't mean you can construct a system that comprehends words. Solving this essential piece of the puzzle falls into the realm of NLP.

NLP is probably the most difficult challenge that AI researchers face. If they can build devices that truly understand human language—natural language—they will have a powerful tool that will open the way for breakthroughs in other areas.

NLP involves a series of issues that begins with straightforward syntactical analysis of a sentence parsing and continues with semantic analysis, in which the structures identified in parsing are interpreted as pertaining to objects in the known environment. Once these steps are complete, each sentence has to be correlated with the entire conversational history.

The challenges of producing NLP sys-

tems are enormous, and research is going on in many areas. The greatest successes have been in the realm of syntactical and semantic processing in highly restricted knowledge domains (see the text box "Giving Feeling to Speech" on page 168).

Scripts and Frames

Two basic components of NLP, context correlation and pragmatic interpretation, are far less developed than semantic and syntactical parsing. Each of these basic components requires access to one or more databases that contain extensive knowledge about the world; thus, knowledge representation becomes a critical issue.

One classic technique for storing such knowledge is a *script*, which is an environment in which actors and objects have stereotypical roles that are correlated with objects in a sentence. Semantic parsing associates words with these stereotypical notions and can use the known roles in the stereotype to reveal the meaning of the sentence.

A restaurant script, for instance, might contain roles for the waiter and the diner, as well as the associated actions (e.g., reading a menu, ordering a meal, or serving a meal) of the appropriate actors. People mentioned in a sentence who look at or receive a menu might be assigned the role of diners. The comprehension/reason for their visit to the restaurant (i.e., hunger) would be coupled with the probable aftermath of having eaten food (a satisfied appetite and a smaller amount of money).

Another common way of representing knowledge is by using a frame system. In this scenario, each object has associated inheritable properties and attributes. These individual frames are linked as nodes in a directed graph structure (i.e., a semantic network) that illustrates the relationships between the frames. Usually systems identified as *frame-based* have more organization than those labeled *semantic networks*, but the general characteristics of both are the same.

AI researchers have recently realized that cooperating processors can achieve more, faster, than any one processor. As a result, many more NLP systems are being implemented using parallel architectures—preferably on parallel hardware (e.g., hypercubes or transputers). However, using multitasking operating systems provides limited parallel performance.

Interprocess communication is handled most frequently by the *blackboard* method, a technique that allows independent processing modules to post information in a common area (i.e., a blackboard) for other modules to access. Alternatively, message-passing systems can direct information to

BYTE ACTION SUMMARY

Finally, there are easier ways to interact with your computer. With the coming of natural I/O technologies—innovative GUIs, better speech I/O, and novel interfaces—your computer will do more of the work for you.

Music: A Natural Link to Our Emotional Selves

TOD MACHOVER

Many of us believe that the most significant element missing from computers is emotion. One of the ways people convey information is through emotional content. Because music is an important way people communicate emotions, why not use it to interface with our computers?

New Ways to Use an Old Friend

People often think of music as a pleasant enhancement to their everyday lives. They listen to music on the radio while driving a car, on a Walkman while exercising, as a soundtrack of a motion picture, and as soothing ambience while dining or reading.

Various domains of research are transforming the way people learn, perform, listen to, and understand music—the way they naturally integrate it into their lives. These changes suggest that music may soon assume a more central role in our lives.

Researchers are developing a new generation of musical instruments intended to combine virtuosic performance and intelligent computer monitoring. For instance, the MIT Media Lab's hyperinstrument project, which I've directed since 1986, has developed techniques that allow musicians to use their skills on a traditional acoustic instrument to control many simultaneous

layers of computer sound. Recently, researchers at the media lab developed a hypercello for the artist Yo-Yo Ma.

A hyperinstrument is a computer simulation of a musical instrument that goes beyond the capability of the real instrument it's based on. Hyperinstruments are intended to greatly expand a human's control of the instrument and the sound it produces. Few other human skills involve such direct and natural translation of mental concepts into physical movement. Hyperinstruments provide examples of the future of human-computer interface devices.

In their design of hyperinstruments, researchers are trying to develop a purely musical interface: to have the control information transmitted from the user to the computer (and vice versa) either through the natural gestures of the musical performance or through the music itself. This model is important because music seems to represent an abstract outline of people's psychological states.

Although most hyperinstruments are designed for skillful musicians, examples of similar technology are surfacing in applications for music students and music lovers. Researchers are developing systems that will allow people to learn to play instruments, to conduct a virtual orchestra at home, or to learn about musical structure through interactive video games.

The Role of Technology

Ideas such as these bring up important philosophical questions: Should technology encourage creativity or simulate it? Should human-computer interfaces enable everyone to perform certain difficult tasks equally well (serving a kind of prosthetic or compensatory function), or should they allow individual differences to produce different results?

My own work has led me to believe that technology should always promote individualism. Natural applications of technology should permit people to use their skills to control and shape uncharted expressive regions. Certainly, new possibilities discovered through increasingly natural uses of technology should stimulate individuals to master new skills. Musical models truly can help people create new and increasingly natural tools—that is, if they listen carefully.

Tod Machover is an associate professor of music and media at the MIT Media Lab (Cambridge, MA) and director of the lab's experimental media facility. He is a pioneer in the development of hyperinstruments, and his recordings have won many awards both in the U.S. and internationally. You can reach him on BIX c/o "editors" or on Internet as tod@media-lab.mit.edu.

specific modules for action. The blackboard approach was used by L. Erman in the Hearsay II and Hearsay III speech-recognition systems.

In Hearsay II, each independent processing module contains semantic or syntactic information about the language. The blackboard posts hypotheses about the meaning of a particular sentence organized along two axes: time and processing level. A control system supervises the modules to improve the likelihood of success.

On activation (as determined by the con-

trol system), each module examines the state of the blackboard and either modifies the existing hypothesis or writes a new one. When it completes its task, another module performs the same procedure. Specific situational triggers determine when each module should be activated.

Some of the latest NLP systems use neural-network or fuzzy-logic technologies to enhance these AI approaches. In particular, researchers are considering the use of neural networks to implement semantic networks and frames (as well as other direct-

ed acyclical graph applications). Fuzzy logic is useful in implementing semantic grammar and in coping with certain knowledge-representation problems.

Hearing It Talk

Converting text to natural-sounding speech is one of the functions of natural I/O. You may already have encountered applications of speech-output technology in automated voice mail, telephone directory assistance, and over-the-phone banking systems. And you may have listened to

Figure 2: The hierarchical neocognitron can recognize handwritten numerals. Each processing stage contains two layers of neurodes: One observes the previous stage's output, and the other provides limited translational independence of the image. Each successive stage detects higher-level features in the input image; the last stage makes the final character determination.

digitized music output (e.g., background music) from devices such as answering machines and voice-mail systems.

The most natural-sounding text-to-speech systems available use digitized and edited human-voice recordings combined with pitch, intonation, and speed controls to generate fluent sentences. Individual phonemes and combinations of phonemes are recorded and edited for use as needed (see the text box "Toward Continuous-Speech Recognition" on page 158).

Natural-sounding speech is not easy to achieve because word intonation depends to a great extent on the context and meaning of what you say. English has many words that sound alike but have different meanings (e.g., *read*, which can sound like either *red* or *reed*), depending on the context. Further, for many speech-output applications, such as telephone directory assistance or automated banking, the text contains abbreviations, telephone numbers, and other nonword information. Thus, a good speech-generation system must perform some of the same syntactical and semantic processing that NLP systems do.

Once the system translates the text into the appropriate phonetics, it must convert these tokens to specific phonemes that the speech synthesizer can process. But this process can result in an atonal, artificial-sounding output unless the phonemes are further manipulated.

Individual phonemes are not the only factors that make speech sound natural. The transitions between phonemes add a natural flow to what you say. In addition, phonemes in human speech have varying durations in different words and sentences.

To compensate for these effects, many good text-to-speech systems use a rule-based system to help them determine the correct parameters for each sentence. The rules are based on the sentence structure of the message, and they help provide a humanlike sound.

Emotional Highs

Natural I/O deals with human emotions. One of the key ways humans express their feelings is through music. Computers of the future may have to accept, understand, and generate music to participate fully in this type of communication (see the text box "Music: A Natural Link to Our Emotional Selves" on page 137).

Many researchers have developed music-generation systems, using a wide variety of techniques. One example illustrates how such systems can learn to compose their own music.

Teuvo Kohonen began development of a unique music-composition system by analyzing the works of about two dozen composers, from Bach to Beethoven to Brahms. Out of these analyses, he created a collection of grammars that describe how each

composer used notes, chords, and themes.

Kohonen trained a series of neural networks with these grammars; some trained on the grammar of only one composer, and others received training on grammars from two or more composers. Kohonen set up the networks so that they were given signals after training (the details of which Kohonen has kept private) that caused the networks to compose music in the style of a composer it learned from.

The music composed by the networks trained on one composer's grammar is fresh and pleasing. The music generated by networks trained on multiple composers, however, is extremely unusual and extraordinarily interesting, sounding much like a collaboration between, say, Mozart and Bach, or Brahms and Beethoven. Kohonen even has one network trained on all the grammars. That network generates an oddly atonal, quite modernistic music that has a peculiar appeal of its own.

This and other music-synthesis systems can provide computers with a range of emotional response, which soon may well match humans' natural expressiveness.

Reading Your Writing

As you consider the pen and pad in your Big Apple system, it occurs to you that people not only talk to each other, they also write notes. Handwriting recognition is another key form of natural input.

Using a keyboard is a skill that many people never acquire. But most children are taught to print and write. Thus, a computer that recognizes your handwriting is more natural than one that requires you to type in your commands.

Generally, there are two methods by which a system can recognize handwriting. One method is *dynamic recognition*, a process in which the system notes stroke sequences and uses that information to identify the characters. For example, a system might distinguish a capital *E* from a capital *B* in part by the order in which you make the character's strokes. Alternatively, you can use *static recognition*, a technique in which the system only receives the image of the finished character.

Static recognition can be more difficult than dynamic recognition because there is less information available to identify the letter you have written. Stroke order often gives clues to where each character starts and ends—clues that are missing in a static image of the final character. This problem, called *character segmentation*, is probably the most significant challenge faced when constructing a handwriting-recognition system.

Before they develop a handwriting-recognition system, vendors must decide if

they want it to recognize cursive writing as well as printed text. Most commercial systems process only printed letters.

Handwritten characters do not have a fixed size or position, and they can overlap each other in the field of view. They can be translated, rotated, misshapen, or incomplete—all of which makes it hard for the system to recognize the characters.

Neural Networks That Read

Researchers and developers have used a variety of neural-network algorithms to attack the reading problem, from the Reduced Coulomb Energy algorithm to back-propagation networks to the neocognitron (which was developed by Kunihiro Fukushima of Osaka University). A back-propagation network iteratively learns to recognize characters by adjusting the network's weighted connections using back-propagated errors. The neocognitron is a complex hierarchical series of overlapping feature detectors that identify images.

It has the ability to handle most translation and distortion variations with little or no preprocessing (but less success with rotated characters). It pays a price in complexity for this capability, however. A neo-

cognitron network that can recognize only the 10 arabic numerals requires tens of thousands of connections and several layers of neurodes. To achieve such recognition capabilities, the neocognitron uses a complex hierarchical collection of *stages*. Each stage contains two layers of neurodes.

The first layer consists of neurodes that receive small overlapping segments of the image of the image-capture layer. These neurodes extract features from the image, and control neurodes embedded in the layer prevent each small group of neurodes from responding to more than one feature. The second layer of the stage provides limited translational independence by blurring the exact position of each detected feature (see figure 2).

The neocognitron idea is to extract more complex features at each progressive stage. The stages closest to the original image deal with low-level features; later stages handle more complex features and combinations of low-level features. This enables the final stage to identify the letter.

Neatness Matters

Other handwriting-recognition schemes frequently use similar designs, although

the technology that is used may not be a neocognitron or even another neural-network model. As with other image-processing systems, the general rule is to determine low-level features, synthesize these into more complex features, and identify the image from this hierarchical series.

Except in the case of notepad computers, it's rarely sufficient for a handwriting system to recognize the writing of just one person. It usually must be able to process legible handwriting samples from many people. The greatest difficulty here arises from the large training sets required to provide good general recognition.

Because of this problem and the hardware limitations that require network development to be performed in software simulation, parallel network microprocessors that can learn on the chip are just now becoming available. Developing a neural-network handwriting-recognition system requires patience. Training can take weeks, and (depending on the network design used) the networks may never train well.

Taking Notes

Several products can recognize the handwriting of one person (sometimes of a few

Three Good Reasons for Choosing Videx Bar Code Readers:

Portable

Proven performers in any environment—from the office to the outdoors—Videx's family of bar code readers leads the industry as the most portable, durable, programmable data collectors. Make your job easy. Keep track of time, attendance, assets, inventory, work-in-process, shipping and receiving with a bar code reader from Videx®.

TimeWand® I, DuraWand™, and TimeWand II are designed for today's world of diverse applications and

Durable

demanding environments. All at prices that make them the obvious choice.

people). Most notable of these are notepad computers, which use a stylus and a touch-sensitive screen that reacts to the user's handwriting. Such pen-based personal computers must interpret the user's handwriting and convert it into text, as well as process user interactions with software buttons and other interface elements selected by stylus touches.

Pen interfaces offer a number of advantages. You don't have to learn such "unnatural" skills as typing. Additionally, they are portable, and you can use them almost anywhere. Many businesses have found them to be very effective in situations where a lot of data is collected off-site and analyzed or used in other locations.

Disadvantages include having to deal with a system that holds relatively small amounts of data (handwritten text generally takes up more screen space than an equivalent amount of screen-font characters), and the necessity of training the system to recognize each person's handwriting. In addition, pen interfaces still can't reliably comprehend everyone's writing. If you scribble or use cursive writing instead of printing, there's a good chance the system won't be able to translate it correctly.

Notepad computers still make occasional errors, although at least one device uses a rule-based system to correct obvious typos and convert them into reasonable guesses. Among the extensions of these notepad computers are drawing-pad peripherals that let you draw on the screen using a similar pad-and-stylus arrangement.

The best of these drawing devices use a pressure-sensitive surface to relay relative-hand-pressure information to the drawing program. The graphics software uses that data to simulate an artist's heavy (or light) hand with a brush, a pastel, or a pencil. In the best cases, the resulting screen effects are almost indistinguishable from the variety of effects you can achieve with real-life painting tools.

Body Language

Among the other obvious forms of natural input are biological feedback devices that deal with your hand and body motions (see the text box "Feedback Devices: The Human Machine Connection" on page 148). These particular inputs can be processed either through a direct connection between you and your computer (often using fiber optics) or by having your computer watch

your motions and interpret them. The first kind of input is most common today, but some systems can also use intelligent machine vision.

In a body suit or glove, you literally wear the interface. Sensors attached to the fabric of the glove measure angular motions of your fingers, hands, arms, legs, or other body parts. In one product, VPL's DataGlove, the sensors detect the dimming of light passing through a short fiber-optic cable that is aligned over two knuckles of each finger. The cable must be accurately positioned over the center of each joint so that the cable bends when you flex the finger. The bending of the fiber-optic cable causes the light passing through the cable to dim, which provides a measure of the angular deflection of that joint.

A DataGlove subsystem determines the overall position of the hand. The motion of your hand through a magnetic field induces a current in three axial coils on the back of the glove. The magnetic field is generated by three similar coils on a stationary mount within about 3 feet of the glove. A small device mounted on the wrist detects the resulting currents, and microprocessors compute the hand's

Point, Click, and Send

Aggravation Free Faxing for Millions of Windows Users

BitFax for Windows makes sending a fax as easy as printing. Point, click, and send. It's as simple as that. Fax any combination of fonts or graphics from any **Windows application** with a few clicks of a mouse.

There's no need to quit your application, or print a hard copy, or line up for the fax machine. Just point, click, and send. BitFax for Windows does the rest.

BitFax for Windows works with just about any fax/modem card. It's **compatible with all EIA Class I and Class II cards** including AT&T, AST, Best, Cardinal, NEC, TI, Sharp, Zoltrix, and Zoom to name a few.

And Say good-bye to ugly faxes. BitFax for Windows sends your image at an incredible **200 x 200 dpi** resolution.

Bypassing the feeble scanner found in most fax machines means your faxes will be clear, precise, and very readable.

A special **Quick Dial** feature allows single click transmissions and the easy to use phone Book is in **standard dBase format**. Other productivity features include background auto re-dial and fax logging.

BitFax for Windows offers the freedom to send and receive documents and forms directly from your desktop, laptop, or notebook computer. It's available in German, Spanish, Italian, and **French** versions and includes an comprehensive manual. **MS/DOS and OS/2** versions are also available.

But best of all, BitFax for Windows won't cost you a fortune.

The suggested list price is **\$79.00** and dealers may even sell for less.

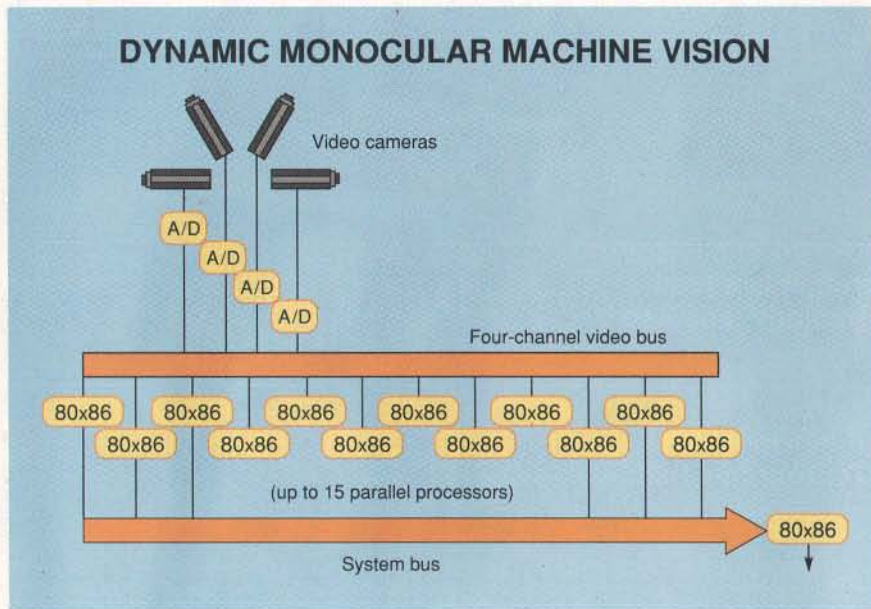

Figure 3: Dickmanns and Graefe's dynamic monocular machine vision system uses custom hardware. The 286-based board has multiple processors that receive four video channels in parallel to provide a wider viewing angle. The on-board RISC controller chip performs many of the image-processing correlation computations.

position within the field.

You must connect this system to a large computer that monitors, controls, and interprets the glove's sensor data. One of the greatest drawbacks to using this device is the physical constraints it involves. Not only must you keep your hand within range of the transmitter coils, but you usually must keep the other end of the glove's cable attached to a large computer that is not particularly portable. Other disadvantages of this kind of system lay in their inherent inaccuracies in measuring and interpreting data.

The most common body suits and gloves are made of stretchy lycra fabrics that fit tightly on the body or hand. The same fabric elasticity that enables you to put on the garment can cause the positions of the sensors relative to the joints and bones to slip and vary as you gesture and move. Some attempts have been made to overcome this predicament, including the development of Exos's Dexterous Hand-Master (DHM), which replaces the glove with an external articulated cage.

To use the DHM, you put your hand inside an awkward-looking but lightweight and natural-feeling metallic articulated skeletal structure. The very nature of this design keeps the angle sensors accurately aligned with your hand and fingers. The result is more accurate input data. Furthermore, this design allows the DMH to detect side-to-side motion, using additional sensors. Overall hand position is deter-

mined using the same induced-current technology found in the DataGlove.

Other types of human-interface devices have been developed, and new, improved generic and application-specific equipment is evolving. The development of human-machine interfaces is a dynamic field, where researchers and vendors are rapidly making significant progress.

Watching You Move

Perhaps a better way to make your computer understand your gestures is to have it interpret them the same way a human would—by watching you move. There are several approaches to natural machine vision systems. In the long run, sophisticated machine vision systems may become more popular for natural I/O than the direct-wire link devices.

Interpreting gestures is not the same as identifying objects in a fixed-frame image. Hand and body movements are actions, and one way to interpret them is to use a dynamic machine vision system. Two German scientists, Ernst Dieter Dickmanns and Volker Graefe, have created such a system. Their dynamic monocular machine vision system provides human-like characteristics to interpret moving images. The ideas behind the system are both simple and profound.

First, assume the system has processed one frame of a movie and located a specific object using traditional image-processing techniques. To locate the same object in

the next frame, it's not necessary to search the entire image. Because real objects don't blink in and out of existence, the most probable location of the object in the next frame is near its position in the first frame.

Using this insight, the Dickmanns and Graefe system localizes the search space for known objects from frame to frame. Rather than searching the entire image for the ball that was in the upper-right corner of the frame in the previous image, their system looks for the ball in a localized search box somewhat larger than the ball's position in the previous image. If it doesn't find the ball there, it expands the box until it locates the ball's new position. In a typical 512- by 512-pixel video camera image, this simple procedure can dramatically reduce the search time for all interesting objects in view.

Because the system is searching each local area for a specific object, its method of search can be optimized for that object. The system can scan the entire locator box using edge-detecting algorithms or another machine vision technique, or it can search the box by looking for a specific kind of surface. Dickmanns and Graefe noted that the human visual system is not perfect when exposed to objects that move rapidly in and out of view (see figure 3).

Although Dickmanns and Graefe have not applied their machine vision system to interpreting hand or body gestures, they have high hopes for its evolution into other related areas. For instance, it provides feature tracking in dynamic scenes, which is just what is needed for gesture interpretation and other applications in the natural-input environment.

A Smile Says It All

A key element missing from all these systems is the ability to perceive and interpret facial expressions. Much human communication occurs through smiles, frowns, and grimaces. The MIT Media Laboratory is a pioneer in this area of study.

Another research group—split between the University of California at San Diego and Dartmouth College—has trained neural networks to recognize facial expressions associated with specific emotions and to identify gender. These scientists used a series of standard 512- by 512-pixel video images of faces expressing emotions (e.g., anger, boredom, and astonishment). The images were reduced to 64 by 64 pixels by averaging the relative gray-scale level in each pixel and normalizing the brightness; they were then passed through a data-compression network. The I/O layers are the same size in this neural network—in this case, 64 by 64 neurons—but the middle layer is significantly

Some people would knock down walls for the kind of freedom we're offering.

Remember images of the Berlin Wall falling: people dancing and singing because, for the first time in generations, they could move freely, with no restrictions?

Today, freedom-loving people have another reason

to celebrate: the Super Cordless Mouse from Z-Nix. With no annoying cord to get in the way, it promises ultimate freedom of movement -- from distances up to 6'

away -- to take full advantage of the Windows® revolution. And it won't discriminate between

right- and left-handed users. No cord, no getting hung up around your coffee cup.

If you think we're exaggerating how much better it can be, just think back to the first time you used a remote controlled

TV. In fact, the Super Cordless Mouse works on similar, dependable technology, using infrared light to transmit data.

And to give you free, uninterrupted use, we designed our mouse with two rechargeable batteries. One is in the mouse, and the other is kept fully charged inside the handy mouse holder which doubles as your infrared receiver. On top of that, as the pioneer of 400 dpi resolution technology, Z-Nix delivers the industry's most developed, intelligent driver software to put special preferences for cursor control in your hands.

The Super Cordless Mouse offers both IBM and Macintosh users unsurpassed freedom and ease of use. For more information on how to get your hands on our mouse, call (714) 629-8050. And let freedom ring.

More room to get things done.

Z-NIX COMPANY, INC.

211 Erie Street, Pomona, CA 91768

No Strings Attached.

smaller. The idea is to train the output layer to reproduce the input image after it has passed through the small middle layer.

Once the data-compression system was able to accurately reproduce the original images, each image was passed through the network, and the resulting response vectors of the middle-layer neurodes were extracted. These compressed vectors became the inputs to a second two-layer network, which identified the emotion expressed by the person in the image.

The scientists achieved good research results. The neural networks were able to correctly identify most of the portrayed emotions, and when the network erred, the mistakes were usually similar to those human judges made on the same photos. In particular, the network more often confused negative emotions (e.g., anger, boredom, and misery) than positive ones (e.g., astonishment, delight, and pleasure). These results are consistent with those derived in human psychological tests.

Given an expanded, enhanced version of this technology, it is conceivable that your Big Apple computer may one day be able to tell when you're feeling blue and offer a cheery joke to lighten your day.

Reading Your Mind

The Big Apple system you purchase in 1993 includes a headband for you to wear, which provides yet another form of natural input: It can read your mind. You wear the headband (or skullcap, depending on design) so that the computer can monitor your brain waves and do what you mean instead of what you say.

Prototype telepathic controllers have already been constructed at the Nippon Telegraph & Telephone labs in Japan and at Stanford University in the U.S. The devices that users wear on their heads can be as simple as a headband or as complex as a lycra helmet. Sensors attached to the device detect the user's brain waves, just as an electroencephalograph detects brain waves (an EEG was the basis for many of the prototypes). The telepathic controllers usually transmitted a few dozen signals to a neural network for interpretation.

The neural networks train as a user concentrates on specific word commands, and the thoughts generate characteristic brain-wave variations. Researchers are just beginning to learn how thoughts affect brain-wave variations.

One or more neural networks interpret the signals and translate them into controlling commands. In one prototype system, a user was asked to concentrate on the words *left*, *right*, *up*, and *down*. The neural network (usually a back-propagation network) learned to interpret the brain-wave characteristics of each word, and it associated them with the appropriate control commands for a joystick. The ultimate result: The joystick moved as a direct response to the user's thoughts.

Several problems must be overcome before this technology becomes part of any commercial product: ensuring the precise positioning of the sensors on the head, shortening the response time of the system, and avoiding the necessity of training the system for each user. Also, it isn't clear how hard you must concentrate on a word to provide an adequate signal for the system to reliably detect.

Ubiquitous Computing

Your Big Apple computer is only one part of what has been termed *ubiquitous computing*. What this term means is that smaller, faster, cheaper, and smarter computers will become essential components of every

Attention U.S. BYTE Subscribers

**BYTE
DECK**

Here's what a BYTE Deck advertiser has to say:

"Ten years ago we advertised in the very first BYTE Deck—the number of sales leads we received was enormous! The BYTE Deck was so successful for us, that we have continued to use it over the past ten years!"

Lisa Tarpoff, Marketing Manager, Heath Company, Benton Harbor, MI

"I can't believe it's not UNIX."

—Sean Fulton, UNIX Today!

Take it from the critics, Coherent is so close to UNIX, you won't believe your eyes. Or the price.

"Mark Williams Co. seems to have mastered the art of illusion; Coherent comes so fully qualified as a UNIX clone, you find yourself thinking 'I can't believe it's not UNIX.'"

—Sean Fulton, UNIX Today!,
November 26, 1990

"...(Coherent) may be the best thing that has happened to UNIX yet."

—William Zachmann, PC Week,
November 5, 1990

"If you want to come as close as you can to real UNIX for a low price, COHERENT can't be beat."

—Warren Keuffel, Computer Language
Magazine, November 1990

"If you want a UNIX-like development and learning system for less than \$100...I don't see how you can go wrong with Coherent."

—David Fiedler, BYTE Magazine,
November 1990

OVER 30,000 USERS, AND MORE EVERY DAY!

Why is Coherent now the world's best-selling UNIX clone?

| | MWC COHERENT Version 3.2 | SCO XENIX 286 Version 2.3.2. |
|----------------------|--------------------------------|------------------------------------|
| No. of Manuals | 1 | 8 |
| No. of Disks | 5 | 21 |
| Kernel Size | 64K | 198K |
| Install Time | 20-30 min. | 3-4 hours |
| Suggested Disk Space | 10 meg | 30 meg |
| Min. Memory Required | 640K | 1-2 meg |
| Performance* | 38.7 sec | 100.3 sec |

Hardware requirements: 1.2 meg 5¼" or 1.4 meg 3½" floppy,
and hard disk.

NEW RELEASE 3.2

\$99.95*

Because like the original UNIX, Coherent is a powerful, multi-user, multi-tasking development system with a complete UNIX-compatible kernel and C compiler.

Features include Lex and Yacc, a vi editor, SCSI support and UUCP capabilities.

And Coherent comes with a full set of over 200 UNIX commands including text processing, program development, administrative and maintenance functions. All of it fully documented in our highly acclaimed 1200 page manual.

WHAT UNIX WAS MEANT TO BE.

Unlike current versions of UNIX, Coherent is lean and efficient. Small and beautifully powerful, the way UNIX was originally designed.

Coherent runs on affordable 286 as well as 386 and 486 based IBM-PCs and compatibles with space to spare. Enough space to keep DOS co-residing on your hard disk.

And it's so fast to install, so fast to learn and just so fast, Coherent leaves UNIX in the dust.

HARD TO BELIEVE? IT KEEPS GETTING BETTER.

Like Coherent, all Mark Williams products are incredible values. Including regular updates with new and enhanced features. Our write-your-own device driver kit. And COHware, contributed software on diskette.

There's also on-going free technical support via telephone. An active user network and a UUCP Bulletin Board System. Plus, with our new 3.2 release:

- A new Korn shell with sophisticated command-line editing.
- Postscript and PCL support for troff adding access to hundreds of new fonts.
- Improved UUCP support.
- International keyboard and character set support.

TAKE 60 DAYS TO CONVINCE YOURSELF.

Will you agree with the critics and Coherent's 25,000-plus users?

Try it. And if you don't think Coherent is everything you ever wanted in UNIX, we'll refund your money. No problem. No hassle.

You can't go wrong. So get to a phone, FAX or mailbox now and order Coherent today. At \$99.95, it's unbelievable.

item you deal with every day.

When this environment becomes commonplace, ordinary items will naturally adapt to you instead of your having to unnaturally adapt to them. You will become so used to this way of interacting with inanimate objects that you won't realize there is a computer inside them.

Xerox Palo Alto Research Center scientist Mark Weiser envisions such a day arriving perhaps as soon as the turn of the century. The scientists in his lab foresee computers embedded in objects at three different scales: inch-scale, foot-scale, and yard-scale. Inch-scale computers include microprocessors buried inside everything from identification badges to electronic chalk to paperless notes. These systems would connect via infrared links to other computers in each room of your home or in your office.

A room will contain countless small computers, none of which needs to be particularly smart. But when they are massively linked via wireless channels, your house or office becomes a place where electronic chalk writes on a yard-scale blackboard and your inch-scale coffee-machine computer asks if you want it to

start your morning brew.

Note that many of these computers need recognize only "yes" and "no"; they do not need to understand language. To you, these devices operate as naturally as they always have, except that now your bulletin board displays information from across the country and your identification badge forwards your calls without any effort on your part.

Today's operating systems and networks, however, can't handle the loads needed to deal with the hundreds of computers that make up your ubiquitously computerized world. To implement this notion, we will have to solve significant problems in software and communications.

For example, operating systems will have to deal with hardware configurations that literally walk out of (or into) the system. And what happens when the window of an application has to move from computer to computer as you walk through a building? We must also enhance our networking technology so that we can seamlessly integrate wireless and hard-wired systems and cope with system configurations that change in the blink of an eye.

The World as You Know It

The last elements of your new Big Apple computer are the helmet and the goggles, with their wraparound three-dimensional display. These devices provide the ultimate in natural I/O—a virtual-reality environment (VR is an artificially generated domain in which you can experience and interact with a complete 3-D world).

The best-known example of this type of virtual space is often portrayed on "Star Trek: The Next Generation" in the Enterprise's holodeck. Simply by programming the computer, crew members can create the London of Sherlock Holmes's time, the Genesis planet, and any other place or time—real or imaginary.

Although the holodeck is fictional, simpler VR systems are already very real. Some of the first impressive VRs were the flight simulators used to train pilots. Using this technology, pilots can experience take-offs and landings, enjoy calm flights, and deal with emergencies. Through practice, they learn to handle airplanes skillfully in every kind of situation.

A good VR system uses some or most of the technologies I've discussed, but it adds at least one more: realistic, often 3-D

Feedback Devices: The Human Machine Connection

BETH MARCUS

Imagine trying to pick a flower with one eye closed or grasp an egg wearing heavy gloves. That's precisely what we're doing in most computer applications. The link between the human and the computer can be either a barrier to productivity or a natural conduit for information and experiences. Now there are new, more natural ways for you to interact with your computer. Feedback technology is ready to reduce the barriers between you and your computer.

Pick any three-dimensional application and describe what you want to accomplish with it and what kinds of variables and objects must be manipulated,

and you are defining the specifications for a feedback device. The applications that feedback technology can enhance are as varied as the applications of virtual reality (VR), 3-D graphics, and high-speed computing.

One of the research institutions now investigating teleconferencing, a feedback-technology application for use in business, is AT&T Bell Laboratories. Obviously, holding teleconferences would be easier and more practical if all parties only had to *feel present* rather than travel to various sites to hold critical meetings. This is just one area in which feedback technology can play a major role.

In medicine, the applications are many, varied, and increasing. Medical students and practicing surgeons must watch videos and observe actual surgery to learn new procedures. With VR, they will have an expert lead them through a procedure, and they can practice as often as they wish.

What's Out There?

Feedback technology has been evolving concurrently with the complexity and capability of computers and applications (see figure A). Following the development of this particular process, the technology diverged into two different directions: toward general-purpose and

NATURAL INPUT DEVICES

Figure A: Faster computing and 3-D applications offered hardware and software manufacturers two choices: Build bigger desks and clone more arms for power users, or develop more capabilities and adaptable input devices to take advantage of our natural dexterity and coordination. Economics and common sense pointed toward developing advanced feedback devices.

special-purpose devices.

3D Trackers, a pioneering effort in the process, measure the position and orientation of a sensor-implanted object in free space. Three of the most widely used products are the Bird by Ascension, the 3Space Tracker by Polhemus, and the 3-D Mouse by Logitech.

To mold an object, manipulate something in your fingertips, or grab an object in a particular orientation, you are required to measure finger and hand motion. By identifying hand gestures and postures, whole-hand devices permit you to do that—and more. Some common examples are the VPL Data-Glove, the Dexterous HandMaster (DHM) from Exos, and the Virtex Cyberglove.

Imagine inserting a key into a lock

without feeling any contact or force. That's what it feels like to use most VR systems. But providing the sense of touch, motion, and force feedback is essential to accomplishing useful tasks with VR. If you take the DHM or any whole-hand sensor and add the Touch-Master (a simple tactile-feedback device), you have an inexpensive, easy-to-use method of displaying contact information. Exos has shown that tactile feedback can sometimes provide performance comparable to force feedback.

Force feedback has been around for a while in the world of robotics, but recently it has taken hold in virtual environments. Tskuba University researchers are developing a system to apply force to the thumb, two fingers, and the palm. The system is being used

to preview new products.

The Sensing and Force Reflecting Exoskeleton is Exos's effort in this direction. The aim of SAFIRE is to provide accurate feedback to the free-moving hand without encumbering or restricting its movement.

Solving Specific Problems

Bell Laboratories has developed a high-performance, compact-force feedback joystick intended for engineering, business, and scientific applications. It could also provide an effective interface for disabled users. This device has been used to navigate through an electronics CAD program. It is not in production, but it could be priced within the reach of workstation or PC power users.

The MIT CAD Lab has developed a controller for sheet-metal design that is like a mouse with a hinge in the middle. Although the first prototype did not provide force feedback, that feature could easily be implemented. With evolution, this device could become a simple, low-cost method of specifying complex CAD shapes.

What's Next

Today, general-purpose feedback devices are probably not cost-effective or available enough to plug in and solve most problems. However, soon these devices will become lighter, more available, and more capable.

In the near future, equipment may exist that will resemble thin, flexible armor with embedded integrated sensor/actuator components. Then newly created techniques and technologies can be turned into a toolkit for designing application-specific devices that will effectively and economically solve problems.

Beth Marcus is president and founder of Exos (Burlington, MA), a company that manufactures medical measurement and rehabilitation equipment. You can reach her on BIX c/o "editors" or on Internet as bam@media-lab.media.mit.edu.

graphical computer output—natural output, if you like—to make the experience look and feel correct and complete. VR can also involve the use of data gloves and body suits, NLP, and sound generation. Some systems, like Autodesk, interface a stationary bicycle to the system so that you appear to pedal your way through a virtual world.

Because VR makes use of a combination of emerging technologies, it makes certain factors more important—for ex-

ample, the key issue of *response speed*. This term refers to the speed at which the system can receive and interpret your input—whether it may be gesture, hand-writing, speech, or thoughts—and react to that input by generating an appropriate output. Again, this output may be sound (e.g., speech, music, and sound effects) as well as text display or graphics. The response can also be a combination of some or all of these.

But don't confuse response speed with

the raw sampling rate of each device. For example, the hand-tracking technology that some data gloves use is able to check the position of a hand approximately 60 times a second. However, internal processing performed by the tracker creates a lag of $\frac{1}{4}$ to $\frac{1}{2}$ second between the input and when the information reaches the master computer. Therefore, there is a discernible delay between what you do and what you see and hear the system do in response.

Another yet-to-be-resolved issue concerns your navigation and manipulation of virtual objects. The system must have prior detailed knowledge of how objects behave in the constraints of the virtual world they inhabit. If, for instance, you attempt to walk through a solid wall or into an empty space, your VR system should provide you with appropriate feedback to inform you that such movements are not acceptable—unless, of course, the VR is a fantasy world with walls you really can walk through.

If you reach for an object, the visual display must not only show you picking it up but also provide some resistance feedback (via the glove) that makes you feel the weight of the object in your hand. Today's technology is still perfecting ways to deal with this issue, but active research and vendor efforts are now under way to provide you with sophisticated feedback mechanisms.

The virtual-world technologies exemplified by the Big Apple computer are very much a reality today. VPL (Redwood City, CA) has just brought its Microcosm VR system to market. Selling for less than \$60,000, Microcosm includes a top-of-the-line Mac Quadra, 3-D authoring software, a helmet with goggles for 3-D viewing and audio, and a glove to control the system. Using the Microcosm, you can tour computer-generated worlds and structures and even pick up objects you find there.

Natural I/O encompasses technologies that range from the here and now to the blue-sky future. One thing is certain: When you purchase that Big Apple a few years from now, you'll find that interacting with it will be vastly different from interacting with today's computers. You may well experience your system rather than use it. ■

Maureen Caudill is a consultant based in San Diego, California, the author of the forthcoming book In Our Own Image, and the coauthor of Understanding Neural Networks: Computer Explorations, which is due to be published soon. She has written dozens of articles and papers in technical journals. You can reach her on BIX c/o "editors."

Put an end to software piracy!

Meet the growing family of security keys from Software Security.

Each one a specialist at enforcing your license agreement in virtually any user environment you can think of. Whether it's DOS, UNIX, Macintosh or OS/2...whether it's a single user installation or a LAN.

Simply connect the appropriate key to a single user computer, or a non-dedicated file server in a network, and you control all access to your protected application.

Users, however, won't even know it's there. The keys are transparent and won't impact software functionality or the ability to make back up copies. Normal mode and LAN operations are unaffected.

Simple. Unassuming. Ever vigilant. Easy to incorporate into your application package. And quite possibly the most profitable hardware investment a software developer can make.

THE POWER OF SPEECH

Many people talk to their computers. Now, the computer may be listening.

SUBRATA DAS AND ARTHUR NADAS

The promise of ubiquitous automatic-speech-recognition (ASR) technology has been tempting people for two decades. Imagine your voice commands understood and obeyed and your speech transcribed automatically and instantaneously.

Today, ASR systems are used to ease or expedite many tasks. Systems that handle a small vocabulary of several hundred words or less are the most prevalent due to their ease of design. This article introduces a simple ASR configuration and cites examples of what you can do with this technology. After delving into some technical details about ASR, we will conclude by previewing some future possibilities.

Putting ASR to Use

Figure 1 shows a typical ASR configuration. The I/O interface consists of the usual assortment of devices (e.g., a monitor, a keyboard, and a mouse) but also contains a microphone for speech input. When you speak into it, the ASR system analyzes your speech, determines what you said, and displays the results on the monitor.

In addition to straight speech transcription, you can also use speech input to control or execute command functions. When entering the contents of a memo, you can create a new paragraph by uttering a command (i.e., "new paragraph"). Similarly, you can scroll up and down the screen or move the cursor using voice commands.

Ideally, an ASR system would work error-free under normal circumstances. But ASR technology is limited by the size of the vocabulary it can handle, the accuracy of its recognition, and other factors. Still, many of the applications within reach of today's technology are impressive.

continued

A SIMPLE ASR CONFIGURATION

Figure 1: To an ASR system, a microphone is simply another input device for a computer system.

Consider an ASR-based medical reporting system. Promptly after examining an x-ray image, a radiologist normally must prepare a written report for the referring physician and the insurance carrier. The normal procedure of dictation by the radiologist and subsequent transcription by a typist—these days using a word processor—is time-consuming, sometimes taking as long as several weeks. It's also expensive, because typists with a knowledge of medical terms command hefty salaries. Using an ASR system, a radiologist can prepare a written report directly.

ASR technology lets medical workers input specialized medical terms by using dedicated built-in vocabulary modules designed for specific tasks. Another application for such technology is hands-busy, eyes-busy situations (e.g., a voice-dialer in a car phone). Speech input is also used to get credit-card authorizations, to query databases (e.g., stock-market quotations), or to access various business information in an organization. Such querying can be done remotely by telephone or in a conversational manner, where a speech syn-

thesizer can enunciate the computer's response. ASR also promises to enable hearing-impaired people to converse over a standard telephone line by transcribing incoming speech and to eliminate the need to use a keyboard to create text documents (see the text box "Voice-Activated Word Processing" on page 156).

Voyager, an interesting experimental prototype of a conversational system, was developed by an MIT team as part of the Defense Advanced Research Project Agency's spoken language system program. Voyager can answer interactively some questions regarding hotels, hospitals, restaurants, and other establishments in a local area. If you ask, "How far is MIT?" it verbally asks for your present location before answering your question.

The Tangora system, an experimental prototype of a voice-operated typewriter for office applications, has come out of the pioneering work of a research group headed by Frederick Jelinek at the IBM Thomas J. Watson Research Center in Yorktown Heights, New York. Its vocabulary consists of 20,000 of the most common words found in office correspondence. Its special-purpose VLSI hardware card plugs into an IBM AT, PS/2, or RISC System/6000 chassis. Demonstrated publicly on numerous occasions since 1987, this is the first large-vocabulary ASR system to operate in real time with high accuracy. One restriction is that you have to pause briefly between uttering successive words when using the system. This technology is characterized as *isolated* or *discrete* speech entry. If some sacrifice in speed and performance can be tolerated, this technology is readily extendable to a larger vocabulary or to the normal continuous manner of speech entry.

Inside ASR

To illustrate the technology that makes up an ASR system, we have chosen a typical system that can handle a large vocabulary of several thousand words. The components of such a system are illustrated in figure 2, and their functions are summarized in the text box "ASR System Component Glossary" on page 154. Later, we will examine alternative configurations.

In a typical ASR system, speech input picked up by the microphone is analyzed by the signal processor. The analysis produces a set of numbers, or features, that represent a centisecond (one one-hundredth of a second) time segment of speech. These features capture important characteristics of speech (e.g., energies in different frequency bands, similar to the energies you control with the equalizer in your stereo) in a compact form. Generated every centi-

second, they constitute a vector of speech parameters.

To understand the captured features, an ASR system uses a vector quantizer and acoustic-model and language-model parameters derived through design or training. The VQ parameters are templates for classifying different speech sounds that roughly correspond to the phonemes in spoken language (e.g., the $\backslash k \backslash$, $\backslash a e \backslash$, and $\backslash t \backslash$ of the word *cat*). ASR designers obtain the templates by examining several thousand vectors of speech parameters belonging to all sound categories that they want to incorporate in the system.

The output of the VQ reflects speech input by matching the incoming vectors against stored templates to determine the sound category of each centisecond. Thus, when you say "cat" to an ASR system, you will probably produce several instances of $\backslash k \backslash$ labels, followed by some labels of $\backslash a e \backslash$ and $\backslash t \backslash$, corresponding roughly to the times it took you to pronounce these sounds. However, because no one knows how to design a perfect VQ, the output of a typical VQ usually contains labels of similar sounds interlaced with the $\backslash k \backslash$, $\backslash a e \backslash$, and $\backslash t \backslash$ labels. Thus, you may find several occurrences of $\backslash e h \backslash$ (as in the word *pet*) and $\backslash u h \backslash$ (as in *cut*) labels, which sound similar to $\backslash a e \backslash$. In addition, transitional portions of speech (i.e., where the sound changes from one phoneme to another) tend to get mislabeled because the intermediate speech-parameter vectors poorly match the templates of either the preceding or the following sound.

Matters are complicated further because you practically never say a word or a sentence twice in the same way. Usually you are unaware of such diversity because of effective compensation by the human auditory system. Because this compensation mechanism is not well understood, these variations are usually attributed to noise in the auditory system. Thus far, the most successful approach to dealing with such noise is based on the hidden Markov model (HMM) principle rooted in information theory and statistics.

An HMM consists of hidden states (S), hidden transitions between the states, and observable outputs (L) associated with the states. In ASR, you assume that each state gives rise to one or more labels, or outputs (L): Each state accounts for one or more centisecond's worth of speech data.

These models need two kinds of probabilities: transition probabilities for going from state S to state S' and output probabilities for producing the label L during such a transition. These probabilities are organized to form a transition-matrix (P_{ll}) and an output-probability matrix (llQ).

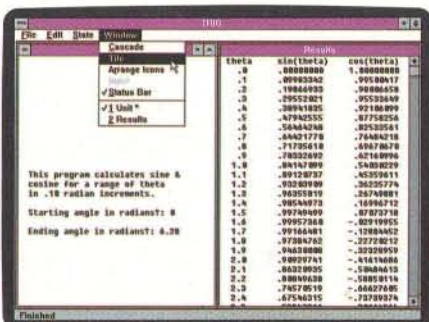

continued

BYTE ACTION SUMMARY

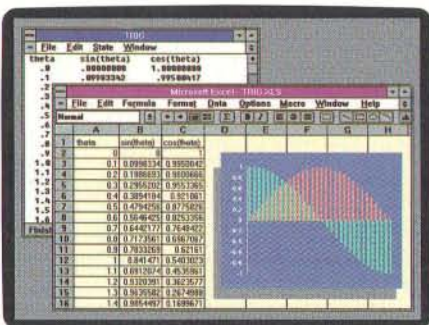

A computer that responds to spoken commands is no longer the stuff of science fiction. Automatic speech recognition is emerging from the research lab to radically change how we can work with computers.

Windows helps FORTRAN users create bigger apps.

The Microsoft Windows graphical environment lets you have multiple windows in your FORTRAN applications. This means that you can resize and scroll input and output displays to view data...

...and to analyze data, simply cut and paste your FORTRAN output into programs such as Microsoft Excel for Windows and you can view it instantly in graphical form.

With the new Microsoft® FORTRAN Professional Development System version 5.1, your existing code taps into the power of the Microsoft Windows™ graphical environment. FORTRAN 5.1's new QuickWin library lets you develop 16-bit apps that access greater memory than ever before – breaking the 640K barrier on 286 and 386 machines.

You can use the FORTRAN QuickWin library to take advantage of multiple I/O windows, multitasking, and cut and paste. Or write FORTRAN routines called from mixed-language Windows apps. And FORTRAN 5.1 has Programmer's WorkBench, with a new CodeView® debugger and Source Browser.

To see the advantages of bigger, multi-windowed 16-bit applications, give us a call at (800) 541-1261, Department R34 and order your FORTRAN update today.

*As used herein, "DOS" refers to MS-DOS or PC-DOS operating systems. © 1991 Microsoft Corporation. All rights reserved. Printed in the U.S.A. Inside the 50 United States, call (800) 541-1261, Dept. R34; outside the 50 United States, call (206) 936-8661. Customers in Canada, call (416) 568-3503. Microsoft, MS-DOS, OS/2, CodeView and the Microsoft logo are registered trademarks and Windows and Making it all make sense are trademarks of Microsoft Corporation.

Key Features

- Create Windows .DLLs in FORTRAN using new or existing code.
- QuickWin Features:
 - QuickWin child windows are easily created using the OPEN statement.
 - User-defined positioning and titles for child windows.
 - Automatically generated scroll bars for output that extends past a single screen.
- CodeView debugger supports DOS*, Windows-based and OS/2* applications.
- Extended CodeView debugger for large DOS programs.
- Complete online documentation for the FORTRAN language and all compile and link switches.
- DOS and OS/2 run-time libraries are compatible with other Microsoft languages.
- Floating-point support includes co-processor, emulation, and alternate math libraries.
- 100% ANSI 77 compatibility and numerous IBM*, VAX* and ANSI 8X extensions.
- New BYTE keyword emulates VAX data types.
- Language Extensions include DOUBLE COMPLEX variables, precision and maxexponent inquiries.

PROGRAMMER'S TIPS

- Use the new /MW option with the FL command to invoke the QuickWin library. For example: "FL/MW MYAPP.FOR" is all it takes to make MYAPP a Windows-based program.
- Use the ALLOCATE statement to dynamically size arrays and to access more than 16MB of memory on a 386.*

Microsoft

ASR System Component Glossary

acoustic model—Models acoustic behavior of words by gluing together models of smaller units, such as phonemes.

decoder—Analyzes VQ label streams with the help of acoustic and language models to determine what was spoken.

interface—Contains I/O devices, including a microphone for user input to the ASR system.

language model—Models a language probabilistically based on context.

signal processor—Converts speech into a set of characteristic numbers at a regular interval, typically every one one-hundredth of a second.

vector quantizer (VQ)—Converts signal-processor output into a stream of labels identifying various sound categories.

Typically you start the model in a state at time 0. Now assume S_0 equals 1, and imagine that at times 1, 2, ..., T —some sequence of states S_1, S_2, \dots, S_T —is traversed. The state after state S is chosen according to the probabilities in row S of the matrix P_{ll} . This is the *Markov property*. The label L produced at this time is chosen according to the probabilities in llQ .

To apply the HMM principle to acoustic modeling in ASR, you first represent each word in the vocabulary of the system with a *baseform*, or a string of phonetic symbols specifying the cardinal pronunciation for the word. The baseform for *cat*, for example, would be $\backslash k \backslash \text{ae} \backslash t \backslash$. Each phonetic symbol is viewed as an HMM whose output corresponds to a part of the stream of labels received from the

VQ. The model for a word is constructed by combining HMMs for the phonemes.

Speech Training

The probabilities associated with HMMs are estimated from training data obtained by reading a known script. The method for this estimation is known as the *maximum-likelihood principle*, which maximizes the probability of the data as the statistical parameters of the assumed HMMs vary. The maximization is performed by an efficient iterative training procedure invented by L. E. Baum and his colleagues at the Institute of Defense Analyses, and the procedure is variously known as the Forward-Backward, Baum-Welch, or Expectation-Maximization algorithm.

The statistical parameters that an ASR

system has to learn are the transition probabilities (P_{ll}) and the output probabilities (llQ) of the various models. If the hidden states were observable, this training would be very simple. The estimate of any transition probability would be the fraction of the number of times the transition occurred. Similarly, the estimate of any output probabilities would be the fraction of the number of times a particular label occurred. Because states are hidden, however, the training algorithm cannot make such straightforward extrapolations.

Training algorithms do the next-best thing—they compute these fractions using estimates of the hidden numerators and denominators. For example, a typical training algorithm might consist of the following steps:

1. *Initialization.* Fix reasonable initial values for each of the transition and output probabilities.
2. *Expectation.* Using the last estimates of all probabilities, compute the expected value of all counts of numerators and denominators.
3. *Reestimation.* Reestimate each probability as ratios of the expected values in the expectation step.
4. *Iteration.* Jump to the expectation step or stop.

In practice, five or six iterations of steps 2 and 3 are usually sufficient.

Because our primary modeling unit is based on phonemes, not words, the training data need not (and usually does not) contain examples of each of the thousands of words in the system's vocabulary. Only sufficient data is needed to model the 50 or so phonemes in the language.

Another component of our ASR system is the language model, which helps predict a future word based on past input words. For example, if the Shakespeare in you recites, "To be or not to," and then says "be," the ASR system should understand that you mean *be*, and not *bee* or *B*. The language model makes such decisions with the help of probabilities that reflect how often a word appears in a given context. For instance, *bi-gram* probabilities represent this context in terms of word pairs. The system precomputes probabilities by examining a body of text containing several million words.

The last component of an ASR system is the decoder, which examines the input stream of VQ labels and applies acoustic-model and language-model probabilities to convert the label stream into a sequence of words. A two-stage operation is typical. The first stage is a quick approximate search to trim down the list of potential

ASR SYSTEM COMPONENTS

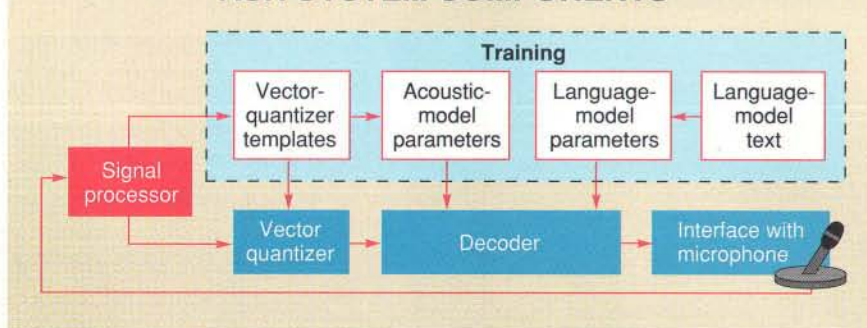

Figure 2: The components of an ASR system work in synchrony to produce the best possible interpretation of speech input.

The world's most advanced input device is right under your nose.

Speech Recognition

For People and their Machines.

Imagine an input device so advanced that it's not only fast, easy and reliable, it's absolutely hands-free! Imagine making your computers easier to use and your users more productive. Right now!

For the past decade, **Dragon Systems** has successfully pioneered high performance, computationally efficient, flexible **speech recognition** technology. As the world leader in PC-based **speech recognition** systems, **Dragon Systems** makes speech input genuinely practical and powerful.

With vocabularies up to 30,000 words, our systems handle everything from simple commands and data entry tasks to full scale dictation. Our revolutionary speaker adaptation dynamically learns people's voices as they use the system. This feature saves user time and maximizes performance and throughput. Automatically!

For System Designers and Integrators.

Face the future with a strategic advantage. Enhance your word processing and database applications. Breathe fire into your new visions. **Dragon Systems** can help you create the unique market advantage that sets you apart from – and ahead of – the competition.

Dragon Systems Speech Recognition

**The computer interface of the 21st century,
a decade early!™**

Voice-Activated Word Processing

RAYMOND C. KURZWEIL

Three years ago, the only people using large-vocabulary automatic speech recognition to create written documents were technology enthusiasts, including a number of speech-recognition developers. Today, large-vocabulary ASR has moved significantly beyond these classical early adopters, and it's used by thousands of people every day to create professional reports.

These users (most of them doctors) benefit from the integration of robust large-vocabulary ASR with an expert system for creating reports in specific domains. These systems combine a free-text mode for general-purpose dictation with detailed knowledge bases (in such areas as emergency medicine, radiology, and pathology) to assist rapid dictation of structured reports.

Large-vocabulary ASR has also found acceptance by hands-impaired individuals. Products for this population have been marketed by Kurzweil Applied Intelligence (KAI), Dragon Systems, and IBM.

ASR technology has always benefitted from high processing speeds and lots of megabytes of storage, and the ongoing geometric advances in semiconductor technology have been very much in its favor. With 20-million-instruction-per-second personal computers a reality and 100-MIPS personal computers waiting in the wings, you will see continued progress in the via-

bility of ASR over the next several years. Knowledge-base applications will continue to evolve, with applications developing outside medicine in such areas as law and financial services.

Of particular significance to the average computer user will be the emergence of viable voice-activated word processors (VAWPs) for general-purpose text creation. Key to this application is a very large vocabulary (on the order of 50,000 words), true speaker independence (i.e., the ability to recognize a user's voice without previous exposure to that voice), high accuracy, and noise immunity. Such systems will combine the ease of use and the speed advantage of dictation with the immediate inspection and error-correction power of the keyboard. Not all people have keyboard skills, but most of us readily communicate through speech.

KAI is progressing toward the VAWP. It's working on a discrete-speech ASR system with a 50,000-word vocabulary (40,000 core words and the ability to add 10,000 user-specific words) and quickly accessible knowledge of 200,000 words. The system is speaker independent for most users, although it improves its performance as it adapts to a particular user.

In a joint project with Fuji and Xerox, KAI has also developed a large-vocabulary continuous-speech system for Japanese. Because of the enormous size of the kanji character set (over

7000 symbols), the Japanese have greater difficulty than English-speaking people do in entering text by keyboard, so large-vocabulary ASR will be particularly useful with the Japanese language. Late last year in Tokyo, KAI demonstrated a research system that recognizes continuous speech in near real time and has a 20,000-word vocabulary. KAI is also adapting similar techniques toward development of a fully continuous, large-vocabulary English system.

Speech is our most powerful way of communicating, and it has long been assumed that ASR will ultimately be a ubiquitous interface between man and machine. The only question has been when suitable ASR technology would become available.

There already are thousands of users who are harnessing this technology to create most of their written documents. As a result of strides made in ASR algorithmic development and the stunning pace of the semiconductor revolution, you will see increasing acceptance of ASR as an input method in the years ahead.

Raymond C. Kurzweil is the founder, chairman, and co-CEO of Kurzweil Applied Intelligence (Waltham, MA). He has been a pioneer in the area of speech-pattern recognition since the mid-1970s. You can reach him on BIX c/o "editors."

words. The second stage is a more thorough search. The search strategy takes advantage of the stack-decoder algorithm.

The decoder computes probabilities of word strings (partial and complete sentences) and searches for the most probable complete sentence given the speech data (i.e., the string of labels produced by the VQ). The decoder maintains a stack of partial sentences, with the entries ordered from the top down in order of decreasing probability. A special end-of-sentence word must be at the end of each sentence. The stack entries are extended one word at a time, and the stack is reordered. The pro-

cess stops when the top of the stack has a word string with an end-of-sentence word. This word string is the decoded sentence.

Combine all these components, and you have a user-ready ASR system. When you speak, the signal processor puts out speech-parameter vectors every centisecond. The VQ receives them and emits a stream of labels for the decoder. The decoder analyzes these labels and attempts to determine the sequence of words that you said.

Limitations of ASR

Ideally, an ASR system would have an unlimited vocabulary, allowing you to say

any word that comes to mind. In reality, practical considerations limit your options. Large vocabularies tend to increase the error rate and processing time.

When the vocabulary is sufficiently small (i.e., limited to several hundred words or less), simpler systems based on dynamic programming matching are often adequate. Such systems use a matching procedure between speech-parameter vectors of two utterances that have time segments that can be deleted or extended to accommodate normal temporal variations in the utterances. To apply this matching, you ensure the beginning and the ending

Your favorite technical handbooks are now available in soft editions.

A new approach to math.

Introducing the Mathcad 3.1 Software System for Microsoft Windows or UNIX. It revolutionizes math by letting you zip through problems naturally and logically—because it works the way you think. And now it's even more powerful, thanks to new Electronic Handbooks™.

More than a number-cruncher.

With Mathcad 3.1, you type your work anywhere into the live screen—just like you'd write on a scratchpad—and Mathcad does the calculating. Updates answers when a variable changes. Even graphs in 2-D or 3-D.

Symbolic calculation capabilities let you do integrals, Taylor series, or infinite sum calculations with click-and-drag simplicity.

And when you're done, Mathcad prints out presentation-quality documents complete with equations in real math notation.

Fast electronic access to commonly used methods, formulas and diagrams.

Mathcad's new Electronic Handbooks give you instant access to the formulas, methods,

mulas for specific calculations. Change parameters, plots and variables, and let Mathcad automatically calculate your answers within the Handbook. Or double-click on a Handbook entry and paste it into your Mathcad document—with the correct units!

Three new optional Mathcad Electronic Handbooks* are now available, each created in conjunction with a leading publisher of technical reference handbooks:

- **Mathcad Treasury of Methods and Formulas** offers you a host of the methods, formulas and diagrams you use every day, along with interactive explanations of every feature and algorithm of Mathcad.
- **Machine Design and Analysis** from Hicks' *Standard Handbook of Engineering Calculations* from McGraw-Hill, contains more than 125 practical calculation procedures including shaft and gear mechanics, time and power to cut, drill, bore, countersink, and a lot more.

• The CRC

Materials Science and Engineering Handbook contains more than 140 tables of data, bit-mapped illustrations, and Mathcad plots. Includes densities, melting points and crystal structures of elements, properties of ceramics and superconducting materials, and much more.

Also Available:

- **Optional Applications Packs**—adaptable Mathcad templates for Electrical, Mechanical, Civil and Chemical Engineering, Statistics, Advanced Math, and Numerical Methods.
- PC DOS and Macintosh® versions also available.

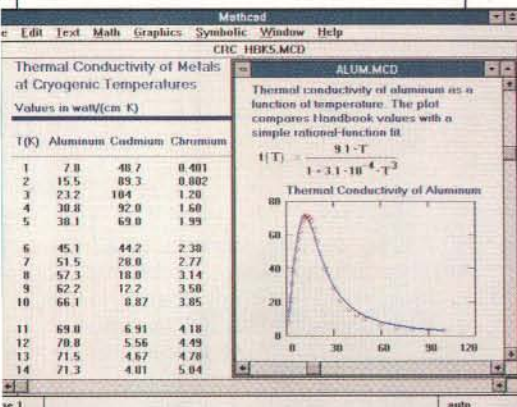

Free demo disk.

For a FREE Mathcad demo disk, or upgrade information, call 1-800-MATHCAD (or 617-577-1017, Fax 617-577-8829). Or see your software dealer.

*Electronic Handbooks require Mathcad 3.1 and Microsoft Windows 3.0 (or higher) or UNIX.

Toward Continuous-Speech Recognition

BART VERHAEGHE

Continuous-speech recognition on a personal computer is the use of natural, fluent speech to input text or a command (e.g., open a file). The various methods used to implement this technology are based on three primary techniques: speaker-dependent, speaker-adaptive, and speaker-independent recognition.

Many commercial products feature continuous-speech recognition, but they use only the speaker-dependent and speaker-adaptive methods. The process of training involves pronouncing words or phonemes for the computer and correcting its speech-recognition errors until it becomes familiar with your voice.

Speaker-independent recognition lets anyone use voice commands without specific training. Lernout & Hauspie Speech Products in Belgium has produced such systems for English, French, and Dutch, and it's working on Spanish, German, Italian, and Japanese versions. A system demonstrated by the company recognizes 2500 speaker-adaptive words and 200 speaker-independent words.

Speaker-independent phoneme recognition lets you easily modify the set of words to be recognized. An automatic text-to-phoneme algorithm converts words into their corresponding

phonetic transcriptions. The phoneme templates are concatenated to form the new word template. Text-to-phoneme conversion is part of the linguistic processing in speech synthesis. (See "Even as We Speak" on page 165.) Companies that develop speech synthesis and speech recognition combine the two technologies for this reason.

Until now, speech recognizers could not distinguish between relevant and irrelevant information. *Word spotting*, a technique that allows users to speak fluently and naturally to a computer, helps them make this distinction. Both Bellcore and Lernout & Hauspie are developing this technique.

For example, starting an application under Windows could sound like, "Please start...euh...spreadsheet." The command is recognized as "start application spreadsheet." Word spotting allows the system to detect keywords in continuous-speech input strings; you don't have to pronounce the commands exactly or as discrete utterances. Coughing, background noise, and irrelevant words don't result in the recognition of a wrong command.

Word spotting is useful for command and control applications, although it cannot be used for the dictation of large vocabularies. The larger the vocabulary, the more complex the linguistic

knowledge involved becomes. For example, transcribing "two plus two equals four" involves (among other things) distinguishing *two* from *to*, *too*, or *toe* and recognizing the difference between *four*, *for*, and *fore*. Semantic analysis calculates the highest probability of correct interpretation in the context of usage. In this example, the words *plus* and *equals* determine the correct recognition of *two* and *four*.

The future of continuous-speech recognition will be in speaker-independent continuous-speech recognition with large vocabularies. Making machines that can recognize any speech from any person, without training, is at least five to 10 years away. In the meantime, useful applications of the technology are emerging. As personal computers become more powerful and the price of digital signal processor power and memory drops, your own voice will become the ultimate input device.

Bart Verhaeghe is manager of U.S. operations at Lernout & Hauspie Speech Products. He has been working in the speech I/O field for four years and is a speaker at the American Voice Input Output Society's voice and speech technical conferences. You can reach him on BIX c/o "editors."

segments of the words remain unchanged and adjust the intermediate time segments within certain constraints to achieve an optimum match.

Recognition systems typically work much better if you input isolated words as opposed to a continuous word stream (see the text box "Toward Continuous-Speech Recognition" above). Also, speaker-dependent systems (i.e., where the VQ templates and acoustic model probabilities are tailored to each user after being trained with some of the user's speech) generally outperform speaker-independent systems (i.e.,

where parameters are based on a common pool of data from several speakers).

Another approach is to start with the recognizer on a speaker-independent footing and adaptively improve its performance during operation by continually modifying the parameters to suit the characteristics of the user. Language-model probabilities can also be updated to capture the composition style of the user.

In laboratory studies of speaker-dependent 20,000-word ASR systems, we typically register 98 percent word-accuracy rates with isolated-word speech input and

90 percent accuracy rates with continuously spoken utterances. Problematical factors for ASR include sounds of lip smacking, breath noise, and the "uh" and "um" sounds that many people produce unconsciously. Background noise and speech entry through a telephone line tend to degrade the performance as well.

Speech recognizers make mistakes, and you need an efficient way to correct them. This is where some human factors surface. Would you prefer to correct an error as soon as it's made or to wait until the document is complete and then proofread it?

Coprocessor Power Tools!

No matter which coprocessor you choose, Microway's family of NDP compilers do the best job of creating globally optimized 32-bit code to drive them. Users throughout the world have found that if they want their code to run fast, there is only one choice, NDP.

We recently heard from a customer who spent over six months porting his application to extended DOS with a competing product. He discovered that his 386/387 vector routines ran a factor of two faster when they were compiled

with Microway's NDP C-386. The speed gain was so large that he wrote an interface library to call the NDP routines from his human interface.

All of our compilers are available for DOS, UNIX, and XENIX driving the 387, 387EMC, 3167, 4167, and Number Smasher-860. EZWIN32 provides an easy to use 32-bit Windows environment for software development. Microway's i860 card now runs in the SUN 386i and HP-9000. Our i860 compilers are now available for the Samsung MagicStation.

No matter which Microway language or accelerator you choose, it will run faster and cooler on our 486B²T, the only 486 Tower that combines elegant style with industrial grade power and cooling and the best technical support in the industry.

Microway has been serving the PC numerics community for ten years. We wish to thank all of our customers for their continued support.

For more information, please call Microway's Technical Support Dept. at (508) 746-7341

386, i486 and i860 Compilers

Our NDP family of compilers generate globally optimized, mainframe quality code that runs on the 386, i486, or i860 in protected mode under Windows, DESQview, UNIX, XENIX, SunOS, or extended DOS. The compilers address 4 gigabytes of memory while supporting the 287, 387, Weitek, and Cyrix EMC coprocessors. Applications can mix code from all four compilers and assembly language. To simplify your ports, we offer ClearView, our full-featured, windowing symbolic debugger that works with DOS versions of NDP 386 and i486 compilers.

NDP Fortran™ is a full F77 with F66 and DOD extensions that is 99% VMS compatible. Also contains new F90 features & MS compatibility.

NDP C/C++™ runs in three modes: K&R with Sys V and MS C extensions; 100% ANSI C; and C++ Release 2.1 compatible.

NDP Pascal™ is a full ANSI/IEEE Pascal, with extensions from C and BSD 4.2 Pascal.

NDP Language Pricing

NDP Fortran, C/C++, or Pascal — all products include NDP Tools except for 386/i486 UNIX and XENIX.

386 DOS (includes DOS Extender) ... \$895
486 DOS (includes DOS Extender) ... \$1195
386/i486 UNIX or XENIX ... \$1195
i860 Compilers ... \$1995

EZWIN32™ — Our 32-bit Windows extender runs extended versions of our 32-bit compilers under Windows, eliminating the worry about calling the Windows GUI. EZWIN32 provides a character-based environment that supports standard FORTRAN, C, C++, and Pascal I/O. Price includes one NDP 386 compiler ... \$595

GREX 386/860 — A library of 160 lower level graphics routines (free with DOS compilers): \$495
ClearView™ 3/486 Symbolic Debugger: \$395
NDP-CrossRef™ Our full function cross reference utility that produces comprehensive data and function listings. Available for all NDP compiler versions ... \$195
NDP Plot™ ... \$325
NDP/FFT™ NDP or 80x87 version ... ea. \$250
Halo Professional for 386 ... \$595

NDP NAG™ Workstation library is a subset of the NAG mainframe libraries. Has 172 routines for differential equations and eigenvalue problems, matrix operations, fitting curves, statistics, and regression analysis ... 386 Version: \$895
T800 NAG for Transputers ... \$2750

NumberSmasher-860™

Number Smasher-860 is the highest performance coprocessor card ever to run in an ISA or EISA bus or as part of a transputer system. Delivers up to 80 million floating point operations per second at 40 MHz and produces 11.8 double precision Linpack megaflops. The board comes standard with an EISA or ISA interface, 8 meg of high speed memory, and your choice of NDP Fortran, C/C++, or Pascal for the i860 running under MS-DOS, UNIX, XENIX, SunOS, or DESQview ... 33 MHz: \$5000
40 MHz: \$6000 32 MB version: add \$2500

i860 Vectorizers and Libraries

NDP NAG/860 is a Microway port of the NAG workstation library to the i860 ... \$1495

NDP HALO-860 includes HALO Professional and an interface library which makes HALO directly callable by the i860 ... \$995

860 Vectorizer includes PSR VAST-2 which converts a C or FORTRAN program into a new program which calls the Intel Vector Library. Includes the Intel Vector Library and Microway's i860 Profiler ... \$1495

860 Vector Library — Written for Intel, includes over 400 vector primitives that take advantage of the i860's cache, dual instruction mode, and pipelined multiplier accumulator ... \$495

NDP IMSL/860 is a Microway port of IMSL mainframe library to the 860.

Math Library: \$995 Statistical Library: \$995
Special Functions: \$500 Complete pkg: \$2000

IGL — a 3-D Graphics Pipeline that does geometry and rendering using routines which use the i860's built-in graphics hardware: \$495

Kuck & Associates (KAP) Hand coded libraries for the i860. DSP and Dense Solvers require Basic Math Library which includes BLAS 1, 2 and 3: \$500

- DSP — Over 100 routines including 1 and 2-D correlations and convolutions. Does 1024 Complex FFT in 1 msec. ... \$250
- Dense Array solver package ... \$250

SX Your AT!

FASTCache-SX/Plus™ — The "Windows Solution" — easily converts your 286 into a powerful 25 MHz 386SX by combining Microway's award winning FASTCache-SX accelerator (\$299) with up to 16 megabytes of extended memory. Features a 486-style 8K internal cache from Intel and a 387SX coprocessor socket. Uses a 16-bit slot. FASTCache-SX/Plus-25: \$595 Cable: \$95

486 Workstations

One of Microway's Black Towers is the ideal choice for a cost-effective desktop system, personal supercomputer, file or computation server, or an industrial PC. They come standard with two or more thermostatically controlled fans, 250 Watt motherboard power connectors, and American-manufactured industrial power supplies. Our 386 and 486 motherboards are carefully burned in and tested. Top speeds are 40 MHz for the 386 and 50 MHz for the 486. Each user can choose from a full line of high quality options to customize the workstation to his specific needs. Our 486B²T was a recent *Digital Review* Target Award nominee. The base system includes a sleek, black tower case, a black tactile response keyboard, four megabytes of memory, a 250 Watt American power supply and one floppy drive. Each system is backed up by a one year warranty and the best technical support in the industry.

THE POWER OF SPEECH

Do you prefer to use voice commands or a keyboard and mouse to negotiate your cursor to the erroneous word? These are just a few of the questions faced by interface designers of ASR systems.

There are many other ways to design an ASR system. Signal processors in some ASR systems derive parameters (e.g., linear predictive coefficients) that attempt to capture speech characteristics in the time domain rather than in the frequency domain. If the background is noisy, a noise-adjustment scheme may be needed to maintain good system performance. Some ASR systems use speech parameters directly for acoustic modeling and decoding, bypassing the VQ step. The language model in some cases can be implemented in a more traditional linguistic framework. Another discipline under study for speech recognition is artificial neural networks.

ANNs for ASR describe x , y plots, where x is speech and y represents a range of some interesting linguistic objects (e.g., words, phonemes, and labels). Given speech x , the ANN chooses a word y . The word *neural* in ANN is derived from similarities (not to be taken too seriously) between the ANNs and the way biological neurons are connected to each other. An advantage that ANNs offer over HMMs is that any set of characteristics can be well approximated with ANNs. An advantage that HMMs offer over ANNs is better time-warping ability. The jury is still out on which technique delivers the best results.

What's Next?

Scientists are busy trying to overcome the limits of ASR technology. Projects dealing with issues such as speaker independence or adaptation, continuous speech, unlimited vocabulary, and noise immunity are under way. Commercial systems are already integrating speech recognition into everyday applications. In a related area with vast potential to augment international communication, researchers are developing techniques to automatically translate speech over the telephone from one language to another. A speech synthesizer can be used to reproduce the translated version, preferably in the user's own voice.

Based on the progress achieved over the past decade or so, we expect that these issues will be substantially resolved by the dawn of the twenty-first century. ■

Subrata Das and Arthur Nadas are researchers in the Continuous Speech Recognition Group at the IBM Thomas J. Watson Research Center (Yorktown Heights, NY). You can reach them on BIX c/o "editors" or on Internet as das@watson.ibm.com and nadas@watson.ibm.com, respectively.

27 million Americans can't read. And guess who pays the price.

While American business is trying to stay competitive with foreign companies, it's paying an added penalty. The penalty of double-digit illiteracy.

Believe it or not, 27 million American adults can't read and write. Another 47 million are literate on only the most minimal level. That adds up to almost one third of our entire population... and probably a disturbing number of your employees.

What does illiteracy cost you? Get out your calculator. Illiterate adults make up 50%-75% of our unemployed. Every year they cost us an estimated \$237 billion in lost earnings. They swell our welfare costs by \$6 billion annually and diminish our tax revenues by \$8 billion.

Illiteracy costs you through your community, too. It robs the place where you work and live of its resources. It undermines the potential of the people who make your products and the people who buy them. No dollar figure can be assigned to this. But over the years, this may be the costliest loss of all.

What can your company do about this? It can join in local efforts to fight illiteracy. It can volunteer company dollars and facilities for better school and tutorial programs. It can invest in a more literate community.

The first step is to call the Coalition for Literacy at 1-800-228-8813 or fill out the coupon below. Do it today. You may find it's the greatest cost-saving measure your company has ever taken.

**A literate
America
is a good
investment.**

Coalition for Literacy

- ☐ I want my company to join the fight against illiteracy.
Please send brochure with additional information.
- ☐ We want to discuss funding the Coalition for Literacy.

Developers: Lock Up Your Profits

Windows 3.0
Support Available

We have the key for protecting your software profits and your copyright.

Software piracy's a crime! What it can do to a developer's profit margin is shameful. The cost of development and marketing products demands you receive the revenue you are entitled to. We have the solution.

- Custom hardware and software for each developer
- Encrypted interrogation routines and debug disablers. Over 140 language interfaces available.
- Available active read/write memory and on-board microprocessor provide the ultimate protection
- Keys for PC "compatibles," Macintosh, UNIX and RS-232C standard
- Total compatibility, reliability and end user satisfaction

We have the key.
Call us for more information
or a demonstration package.

How Can Northgate® Offer You A Powerful, Upgradable 486SX™ System For Only \$2449?

Like The Great Sphinx, Some Phenomena May Never Be Explained.

If new technology is always the most expensive, how is it possible that Northgate brings you our latest upgradable Elegance™ ZXP™ 486SX and DX computers at such a phenomenally low cost?

Our new ZIF (Zero Insertion Force) socket lets you quickly upgrade to faster, more powerful processors — even the clock dou-

bler chips now under development. A new chip and a flip of the lever is all it takes. Features include:

- 486SX/16MHz processor
- 4MB of RAM; expands to 32MB
- 100MB IDE hard drive
- 64K cache
- 1.2MB 5.25" and 1.44MB 3.5" floppy drives
- Space-saving 5-bay desktop case; 7-bay Vertical Power case optional
- 14" SVGA color monitor
- Northgate 101-S keyboard

- MS-DOS® 5.0, Microsoft® Windows™ 3.0 and Mouse
- DiagSoft™ QA Plus™ software
- FCC Class B Certified

You also get 24-hour, 7-day a week toll-free technical support, a limited one year parts and labor warranty with on-site service from NCR® (second and third year plans available) and overnight shipment of replacement parts at our expense. Order today and remember — our 30-day money back guarantee means you have

Gazing out over the shifting sands of Giza, Egypt is the Great Sphinx – one of the world's most baffling mysteries. How were the ancients able to carve its massive features over 40 centuries ago? How come the Sphinx shows extensive signs of erosion – not by wind and sand but by water? Who made the Sphinx – ancient Egyptians or a still-earlier civilization? Why was it created? And when? Although scholars continue to look for answers, the centuries-old mystery of the Great Sphinx may never be fully solved.

nothing to lose. And a phenomenal computing solution to gain.

BEFORE PROTECTING YOUR SOFTWARE...

...against piracy and unauthorized use, make sure that your protection system has all the following qualities:

A GOOD HARDWARE KEY

Hardware-based software protection systems are now the standard worldwide. However, not all keys are the same. A good key should have all the following features:

✓ Compatibility and transparency. The key should work without any problem on your customers' computers. The user should be able to forget the key after connecting it.

✓ Unbreakable electronics. A customized ASIC (Application Specific Integrated Circuit) component should be integrated in the key. This prevents reverse engineering and makes cracking virtually impossible.

✓ A unique and inaccessible software developer's code burnt into the ASIC. (This code should not be held in the key's memory, where it can be read and altered.)

✓ A Read/Write Memory inside the key should be available on demand. The memory should be writable in the field, on any PC, without any special programming equipment.

✓ Very low power consumption, enabling the key to work even under the worst power conditions, on PCs and laptops, with or without a printer.

POWERFUL SOFTWARE

Since it's practically impossible to crack or duplicate a key having all the features mentioned above, a pirate will usually go for the software linking the protected program to the plug. Therefore, check that your protection software has all of the following:

✓ A Linkable Protection Module with which calls can be made to the key from any point in the protected program.

✓ An "Envelope" installation program. Such programs enhance security while making it possible to protect a software even without its source code.

✓ Sophisticated antidebugging and encryption mechanisms.

HASP, THE PROFESSIONAL SOFTWARE PROTECTION SYSTEM, OFFERS YOU ALL THESE FEATURES AND MORE:

HASP was designed by a team of computer experts, professional cryptologists, and electrical engineers. As a result, HASP keys are supported by what is probably the best software in the market, and the HASP system has worked on every computer it has been tried on. In addition to all the features mentioned above, HASP provides:

✓ A Full Authorization

System for protecting dozens of programs using only one key.

✓ A Pattern Code Security System (PCS)

enabling parallel processing of multiple calls by the Linkable Protection Module.

✓ A Virus Detection option that can be incorporated in the protected program to check whether it has been infected by a virus or tampered with in any way.

✓ Operating systems supported: DOS, SCO Xenix & Unix-386, OS/2, WINDOWS, AIX, AUTOCAD, PHAR-LAP, ERGO and RATIONAL DOS Extenders.

✓ NetHASP provides full support for protecting DOS and WINDOWS software under network environments, including Novell dedicated & non-dedicated servers, Lan Manager, Lantastic, Banyan, DLink, and all NET-BIOS based LANs.

IN A TEST CARRIED OUT BY AN INDEPENDENT LAB, HASP WAS THE ONLY KEY WHICH WAS NOT BROKEN*.

AND THE BOTTOM LINE:

we offer some of the most competitive prices in the market.

During the last seven years, HASP has enabled thousands of software producers in more than 40 countries, including several Fortune 500 companies, to protect their software.

To learn more about why so many professionals have chosen HASP, please contact:

EVEN AS WE SPEAK

The use of voice synthesis delivers the world of computer information
in a natural form of human communication

JOSEPH J. LAZZARO

The fax you've been waiting for all day hasn't arrived. It's six o'clock; you know it's coming—soon. You have spent many nights like this chained to your office, but tonight is different. You grab your coat and head to the car. Dinner is at seven, the kids' school play is tonight, or you have a stress headache—all good reasons why waiting around the office for a fax that could affect the rest of your career is out of the question.

After 15 minutes of sitting in traffic, you dial into your new voice-automated fax machine. You punch in your code number, and the machine replies, "I'm sorry; there are no new fax messages in your in basket." You try again 20 minutes later. The same pleasant-sounding semirobotic voice confirms there is a fax transmission addressed to you, and it reads you the message's contents as it simultaneously prints a copy of the message on your printer. No more long, lonely nights in front of the fax machine.

As personal computers continue their evolution, it's only logical that they be granted the power of the spoken word through speech synthesis. Speech synthesis is the artificial generation of the spoken word using computer-based hardware and software.

If you tend to view the development of computers in biological terms, the electronic species are gaining more flexibility as their I/O devices continue to acquire greater capabilities. If you carry this idea to its limits, the ultimate natural I/O system for a computer is voice recognition combined with voice synthesis, because it emulates our own normal communication methods.

Climbing the Linguistic Ladder

The human species is one of the rare forms of life on this planet that can claim a spoken form of language. Our natural verbal ability has often been declared our most powerful attribute, and the biological hardware and firmware that make this possible took millions of years to evolve to their present state. Thanks to R&D performed more than a decade ago, computers have also begun their climb up the linguistic ladder.

We have a competent understanding of how to duplicate the human speech mechanism, and there are numerous voice syn-

thesizers and software packages that are a direct result of this knowledge. The presence of dozens of speech products might lead you to believe that all the problems have been solved, but there are still areas to be colored in and refinements to be made.

The most difficult aspect of speech synthesis is that it is an attempt to replicate a human function that is not perfectly understood. Speech synthesis is not confined to generating the correct pronunciations of words in isolation. Many rules must be followed to produce correct synthetic speech. The pronunciation of a word is different if it appears at the beginning, middle, or end of a sentence. A word or phrase can be given special meaning merely by raising its pitch or volume when spoken. (See the text box "Giving Feeling to Speech" on page 168.)

Computer-based speech-synthesis systems emulate our natural-language ability with the help of megabytes of computer code and millions of instructions per second of raw processor power. With all this advanced technology, the finest voice synthesizers on the market today can still be distinguished from a human speaker by an inexperienced listener. Many speech-synthesis systems are obviously robots, sounding like computerized characters from science fiction; other systems come close to our subconscious ability to articulate.

The typical personal computer can be fitted with speech by merely adding a circuit card or external voice box and the appropriate text-to-speech software to make it all work together. There are even speech-synthesis products for laptop and notebook computers, making these portable machines efficient talkers as well. Even the GUI is starting to become verbal as speech packages designed for these systems hit the market.

Speech synthesis is valuable in a telephone environment, where video screens are not present to display information to you. Unlimited-vocabulary text-to-speech systems are important for verbalizing large, dynamic databases.

Speech is capable of verbalizing the contents of a computer screen for those unable to read because of vision or learning problems. Speech can also add life and emphasis to multimedia applications, as color text and graphics combine with natural-sounding voice output to create user-friendly applications. With all this in mind, I'll take a look at how a typical speech-synthesis system works.

Worth a Thousand Words

A speech synthesizer is essentially a dedicated microcomputer that is committed to running its text-to-speech software. It can come bundled as an internal circuit card capable of being plugged into the bus slot of most personal computers. Voice synthesizers can also be external units designed especially for serial or parallel interface ports.

Voice synthesizers contain many of the same components found in microcomputers. These include RAM for running the text-to-speech software, which is loaded into the system memory from floppy or hard disks.

The more powerful speech units include an on-board microprocessor, which provides enough computing power for their operation and takes a significant amount of pressure off the host microcomputer system. Voice synthesizers also contain digital signal processors (DSPs) to crunch the sheer bulk of numbers necessary to re-create the complex waveforms that make up human speech. The D/A converter is also a major player in many speech-synthesis products, because these dedicated chips reproduce complex waveforms based on high-speed digital signals.

The DECtalk PC is a high-end internal speech synthesizer and a self-contained microcomputer in its own right. The board is based on the previous DTC01 synthesizer and has nine different voices on-board. The heart of the system is an 80186 microprocessor, a megabyte of RAM, and

BYTE ACTION SUMMARY

Voice output is no longer just a glitzy option for your computer. Now it's a practical method for accessing information, and there are many mature hardware and software products available to make voice output a reality.

EVEN AS WE SPEAK

a Texas Instruments (TI) TMS320 DSP. The DECTalk PC can speak at a rate of 120 to 550 words per minute and contains more than 1400 letter-to-sound rules.

Street Electronics' Echo PC II is another example of an in-board speech synthesizer for AT-bus computer systems. The synthesizer has an unlimited vocabulary and comes bundled with an external speaker and text-to-speech utilities. In addition to generating speech by rule, the board can also play back digitized sound samples.

The Echo contains a TI TMS50C10 sound chip and a 2-watt audio amplifier. The board can play back 10-bit sound samples at rates of 8, 9.6, and 11 kHz. The Echo can also play back 8-bit samples at rates of 16, 19.2, and 22 kHz. The bandwidth of the Echo synthesizer is about 100 to 4500 Hz. This board is well suited for the programmer who wants to build speech applications, because it's inexpensive and well supported.

Street Electronics is about to roll out a new version of the Echo PC aimed mainly at persons with vision impairments. This synthesizer is portable and powered by a standard 9-volt battery. It's driven by a Motorola 6805 microprocessor and contains 32 KB of internal ROM. The synthesizer can be driven by any serial port capable of communications at 9600 bps.

The unit will come with a headphone, a jack, and text-to-speech software in firmware. Street Electronics hopes to sell the unit for less than \$150. The company also has plans to roll out a clone of the popular Sound Blaster that is capable of performing synthesized and digitized speech functions.

The Mac has its own built-in speech hardware and software, and it was one of the first successful platforms to accomplish this feat. The Mac comes from the factory with a built-in text-to-speech program called MacInTalk, which drives the built-in speech hardware and is capable of generating an unlimited vocabulary. The new Mac platforms also come bundled with a built-in microphone, which makes it easy for developers to create custom voice applications.

The Amiga also comes out of the box with built-in speech capability, and files can easily be dropped into the voice module for reading with an unlimited vocabulary. The speech-output system for the Amiga is part of the operating system, which makes it accessible to programmers interested in incorporating speech into an application.

Speak to Me

The complex process for converting text to speech requires multiple layers of intelli-

gence. Because speech synthesizers are dedicated microcomputers designed to produce speech, their software can be designed to run on specific boards for maximum efficiency. Speech software can also be written in languages that can easily be ported to different systems, making it possible to take advantage of different microprocessors and hardware configurations across platforms.

The software is often broken down into tasks, with each job assigned to one or more modules. These duties include normalization of the incoming text information, conversion of text to phonemes, and processing for sentence and accent stress. These modules work hand in hand, with the output of one module providing the input for the next.

Many speech systems are based on the three-tiered approach developed by Dennis Klatt at MIT. Refinements have been made to this model over the years, including stress parsing and larger dictionaries.

The first software module in a typical text-to-speech system is known as a *text normalizer*. This module is the entry point for incoming ASCII text, and it's responsible for converting the printed word into a form compatible for voice output. The text normalizer strips punctuation from the incoming text, and it converts numbers to words and changes dates to a more pronounceable format.

For example, the dollar amount \$19.95 would not be verbally expressed comprehensibly in its current form. As the figure is written, it would be pronounced "dollar sign one nine point nine five," which would be difficult for a listener to comprehend. The text-normalizer software would convert this phrase to a more manageable form, such as "nineteen dollars and ninety-five cents," resulting in a more easily understood phrase.

The next module to come into play is the *lexicon*, which is responsible for stripping suffix and prefix information from incoming words. This is done to determine the root word so that it can be more easily found in a text-to-phoneme directory. If the lexicon saw the word *goodness*, it would convert it to *good*, greatly simplifying the directory search. The lexicon is useful for weeding out letter combinations that are not true words (e.g., IBM and FBI).

The subsequent program module is the *phoneme converter*, which translates the incoming text from the previous module into phonemes using a RAM-resident dictionary. A phoneme is the smallest sound byte of a language, and English contains about 40 phonemes. This dictionary simplifies the text-to-speech process greatly, because it can guide the synthesizer to perfect pronunciation for the most common words.

The next program segment is *intona-*

PS/2[®] MEMORY

Introducing OS/RAM32plus[™] for the Micro Channel[™]

- ✓ Provides from 2 to 128 Mbytes of fast memory.
- ✓ Works in 16 or 32 bit mode to meet your needs.
- ✓ Provides extended and expanded memory.
- ✓ Fast software and hardware for LIM 4.0 included.
- ✓ Automatic configuration for DOS, OS/2 and UNIX.
- ✓ Easy to install. Risk free guarantee. Two year warranty.
- ✓ Add a disk cache and RAM disk using OS/RAM32plus to get maximum performance from your computer.
- ✓ Free up low memory by moving your drivers and TSR's to OS/RAM32plus. We guarantee compatibility!

Giving Feeling to Speech

JAN ZIMMERMAN

From the subtly sarcastic voice of HAL in *2001* to the subtly sultry voice of the computer in *Star Trek: The Next Generation*, fictional computers speak as if they are your best friend—or your worst enemy. How disappointing to hear nonfictional computers speak in a scratchy voice with the monotonous pace of a marching army on a long, long trek. Thanks to market demand and advances in text-to-speech synthesis, however, the picture is changing.

The advent of hand-held devices that speak, ranging from foreign-language translators to the Bible, has created a demand for an authentic voice. Without natural-language parsing, however, these types of synthesized voices simply consist of a chorus of robots that can't carry a tune.

Parsing Improves Text-to-Speech Synthesis

Natural-language parsing is the ability to understand the underlying structure of a spoken language. It deals with the complex grammar of spoken (i.e., natural) languages, such as English and French, rather than the limited grammar of Pascal or C. Parsing is similar to diagramming sentences, as you used to do in school. With parsing, a text-to-speech synthesizer can operate on the sentence level rather than just word by word, leading to much more natural-sounding speech. (See "A Natural Solution," February BYTE.)

Words whose pronunciation changes according to their use can be handled only with a parser that "knows" how each word functions in a sentence. In the expression "Let's record that record-setting score," the stress is on the second syllable of the verb *record* but on the first syllable of the same

word when it's used as a modifying noun. English has many words like this (e.g., *use*, *convict*, *invalid*).

The science of *prosody* deals with the pitch, amplitude, and duration of sounds in relation to one another. Because it varies according to the construction of a sentence, prosody provides cues that aid in understanding speech. The incorporation of prosody is less obvious, but more important, than simple stress in increasing the intelligibility of synthesized speech.

Almost all medium-priced to expensive synthesizers (e.g., Berkeley Speech Technologies' Bestspeech, Centigram Communications' CallText, or DEC's DECTalk) can raise inflection (i.e., stress) when a question mark appears. "Am I tired?" is pronounced very differently from "Am I tired!" They can also adjust pause length for commas, semicolons, and periods.

But without a parser like the one found in Emerson & Stern's Sound Bytes, it's impossible for synthesizers to adjust pause length at the end of unmarked phrases and clauses (e.g., "I would go...but I'm busy") or to change intonation when a noun is used as an adjective (e.g., "Green is my favorite color" versus "The green leaves turned yellow"). The glue words of English (e.g., articles and prepositions) are generally spoken quickly unless they are important ("I want that"). Without a parser, no way has yet been developed to determine importance. Human speakers provide all these prosodic cues unconsciously to help their listeners understand.

Natural-Language Parsing Trade-Offs

Computer parsers are not as capable as people at handling pronunciation that

changes based on meaning or outside knowledge. In "I read well," the word *read* is pronounced as "red" when used in the past tense, but as "reed" when used in the present tense. The sentence alone cannot convey the writer's intention.

Parsers take up some memory and processing power, but not as much as some computationally intensive forms of synthesis. It's not parsing but the type of synthesis technology that drives the cost-versus-performance trade-off. Synthesizer prices range from \$200 to \$5000.

Bellcore's Orator synthesizer trades the ability to handle free text for the ability to handle names in a telephone directory, which often don't follow English phonetic rules. Some low-cost synthesizers have trouble with words such as *tough*, *through*, *though*, and *thought*, which don't follow English rules either.

What's Coming for Microcomputer Users

With more and more emphasis being placed on multimedia, you can expect PCs to have built-in sound-output capability like that already found in Mac and Next machines. The proliferation of machines and software will eventually lower the cost of high-quality synthesis, and system vendors will try to incorporate at least some parsing capability.

Get ready to buy some headphones or drive your officemates crazy. The talking computer is on the way!

Jan Zimmerman is CEO of Emerson & Stern Associates (San Diego, CA). She speaks and writes frequently on issues concerning speech and language. You can contact her on BIX c/o "editors" or on Applelink at D3881.

tion control, which is responsible for managing word and sentence pauses and pitch, and is mandatory for more believable pronunciation. This program segment bases its decisions on context and word placement. The bulk of inexpensive synthesiz-

ers don't use sophisticated intonation control, which results in a flat, monotone voice that is more difficult to understand. Many developers are focusing their attention on this module, because proper intonation is fundamental to more natural-sounding

speech with less robotic tones.

Sound Bytes from Emerson & Stern Associates (San Diego, CA) is an example of speech software that is geared toward parsing for intonation and stress control. The software runs on the Mac platforms,

*Business Purposes: Marketing, finance, administration,
manufacturing and office automation.*

Texas Instruments' top executives get to the bottom line instantly with Microsoft client-server computing.

Every business wants to know the bottom line. Thanks to Microsoft's client-server computing solution, Texas Instruments' upper management sees it instantly. Right on their own PCs.

"PEOPLE DON'T JUST WANT ACCESS TO DATA. THEY WANT TO CREATE IT, CHANGE IT AND MAKE IT THEIR OWN."

They can also track inventory, monitor sales, check raw material prices and find other information needed to make decisions.

And that's how Jim Powell likes it. Because as Texas Instruments' Manager of Distributed Information Services, it's his job to provide his co-workers with the computer support they need. And with Microsoft client-server computing, his job is a lot easier.

Two years ago, a lot of people at Texas Instruments found the mainframes difficult to use and inflexible.

So Jim started to look at possible solutions. He wanted to find a system that would utilize their existing equipment, allow MIS to rapidly develop applications, and provide the end users with an easy-to-use interface.

He discovered Microsoft client-server computing was just what Texas Instruments needed.

The Windows™ environment was placed on the desktops and Microsoft® LAN Manager and SQL Server were integrated into the system.

There were dividends right away.

Jim's group was able to quickly develop client-server applications, like the executive decision support system. Which means the users didn't have to wait forever to get the computer support they

"NOW I CAN PUT APPLICATIONS INTO THE HANDS OF PEOPLE THAT WOULDN'T HAVE GOTTEN THEM OTHERWISE."

needed. And with Windows, the information on the mainframes was easier to access.

Simply put, Jim was able to get the right information, to the right people, the right way.

If you'd like a case study on Texas

Instruments' migration to Microsoft's client-server solution, call us at (800) 992-3675, Dept. X32. We'll tell you how you can profit from their experience.

Silicon Graphics Memory

and there are plans for it to run on the IBM PC in the near future. The text-to-speech software uses the Mac speaker and D/A converter. The company is now writing a speech toolbox for developers to create their own voice applications.

According to the company, Sound Bytes contains a parser that can determine a word's exact pronunciation from its context. The software can detect the difference between words that are spelled the

We can look forward to higher-quality synthesizers over the next two to five years.

same but pronounced differently, aiding pronunciation dramatically. The software also configures itself to avoid a monotone voice and automatically adjusts its rhythm to provide a more natural quality. The program is written entirely in C, which makes it portable from one platform to another.

Sound Bytes' first step is to input ASCII text, which is fed into a 50-KB word-phonemic dictionary. The next step is to feed incoming text into a parsing system that sets parameters for rhythm and intonation. The following level involves feeding the output into a module that selects the proper diphones for the target text, and the result is sent to the D/A converter for verbalization.

Lernout & Hauspie (Woburn, MA) is working on an open-systems approach to software for text-to-speech synthesis, and it's collaborating with a number of companies in the U.S. and Europe, with the aim of providing multilingual speech software for a number of markets. The software supports American English, Spanish, German, French, Dutch, and Korean, and there are plans to add Italian and Japanese in the second quarter of this year.

Depending on the language, the software uses between 400 and 750 KB of memory. The code is written in C and is easily ported to a number of platforms, making it easier to develop specific applications for a number of markets. The software can be loaded into the RAM of a syn-

thesizer board or box.

Lernout & Hauspie developed a reverse telephone directory using voice recognition and speech synthesis for the Belgian Post Telephone & Telegraph. The software uses heuristics to determine the proper pronunciation of names and addresses from multiple languages. The system is capable of determining the French, German, or Dutch pronunciation of a target phrase. The company also developed a telephone-based E-mail system using speech output for the South Korean government.

Berkeley Speech Systems (Berkeley, CA) is a leader in the speech-synthesis market, and it is offering speech technology to such players as Franklin Home Electronics for a line of portable information-retrieval systems. Berkeley is also keenly interested in the growing fax-to-speech market. First Byte (Santa Ana, CA), maker of the familiar Smooth Talker software, also markets speech software for MS-DOS and Windows. With all this in mind, I'll now look at some of the applications for speech output.

Automatic Mouths

Numerous productive applications take advantage of speech technology, and the list continues to grow. These include conversion of fax to speech, screen-reader software for persons with vision impairments, and telephone voicing of dynamic databases.

One of the most powerful applications of speech technology is reading fax messages with voice. Several cutting-edge companies are working on the problem, and Berkeley Speech Technology has obtained a patent for this money-making process. Fax-to-speech technology is a market that's almost certain to be a winner, because fax messages are so ubiquitous in today's business and industry.

The first step in fax-to-speech conversion is to translate the fax message to ASCII using optical-character-recognition technology. The typical one-page fax message can be converted to ASCII text using OCR in less than a minute. The Calera text-recognition board can convert a fax file stored on disk, or a flatbed scanner can scan paper-based faxes.

Once the fax is scanned into ASCII format, it's readable by a text-to-speech synthesizer. The text is sent to the speech synthesizer, which reads the message in any language that is chosen by the end user. The phone's Touch-Tone keypad is used to control the reading mode, and it can be used to start or stop reading at any time.

The Malibu Software Group (Malibu, CA) is developing a prototype OS/2-based

While Our Competitors Are Diligently Trying To Emulate The SummaSketch® II...

We Proudly Announce SummaSketch II Plus.

The world's best selling, most emulated, most acclaimed desktop tablet just got better. We've taken SummaSketch II, the industry standard, and added several new features to create a tablet that is, unquestionably, the world's best.

Unlike some competitors, we put everything in the box—4-button cursor and 2-button stylus (or 16-button cursor), interface cables and a utilities diskette with Windows® 3.0 and ADI® drivers. Plus we've added things like 2000 lines per inch resolution and 10 mil accuracy—standard. Plus the fastest, easiest set-up and configuration procedure. Plus an offer for a free AutoCAD® or CADKEY® Master Template (a \$245 value). Plus software compatibility

with over 400 programs, and hardware compatibility with PCs and Macintosh®. Best of all, it's still 100% pure SummaSketch—the editor's choice, winner of every major editorial accolade for graphics tablets. And the people's choice, with well over one-half million sold to demanding computer graphics professionals.

**Every
decision**

should be this easy. In fact, the only tough decision is which Plus to choose: 12" x 12" or 18" x 12" Professional. For literature, or the name of your local dealer, call 1-800-729-7866. For technical information call 203-881-5400.

Summagraphics®

Every decision should be this easy.™

EVEN AS WE SPEAK

system that's aimed at converting fax messages to voice in real time. It should be out by the time you read this, and it's anticipated that the system (including a dedicated workstation to house the fax server) will sell for about \$15,000. It will allow a user to play back a fax message through a text-to-speech synthesizer with an unlimited vocabulary under the control of a phone's Touch-Tone keypad. The end user will be able to tie this system into a voice mailbox, and faxes can be played back through the speech board.

Vision-impaired people use talking computers to access text- and graphics-based systems. Sounding Board and the Vocal-Eyes screen reader from GW Micro (Fort Wayne, IN) form a state-of-the-art voice-access package that is capable of working with most DOS-based applications. The software and hardware can provide an unlimited vocabulary for most word processors, databases, spreadsheets, and other software. Outspoken from Berkeley Speech Systems is a GUI-oriented speech package for the Mac, and it's one of the most powerful graphics-based speech packages available to persons who have vision impairments. IBM is also developing Screen Reader/PM, a graphics-based screen-reader program for the visually impaired.

Answering machines were once the only device connected to most telephones. Now, thanks to text-to-speech synthesis, Touch-Tone keypads, and some newer devices linked to the phone line, reams of information can be as close as your fingertips. Speech synthesis is being combined with fax and telecommunications technology to offer a complete data-handling system with remote control.

Centigram Communications' voice-processing technologies are examples of telephone-based information systems. The company specializes in using voice output for transaction processing, data inquiry, text-to-speech applications, and visual output via fax and data. A caller can control a massive database containing technical documentation, listen to a series of voice menus, make selections using the Touch-Tone keypad, and have page after page of technical text and graphics faxed immediately to a distant location.

The Touch-Tone keypad and voice interaction with unlimited vocabulary can be used to trigger downloads from a remote location to a far-off office or job location. The system can also be used to trigger pagers to contact personnel that are in the field or on job calls. Speech-synthesis technology can be used to take the load off workers in an office, particularly when their time is spent delivering simple or

repetitive information to clients (e.g., opening and closing times or address information).

A.B.C.D...

The future of speech synthesis is full of promise. The global market for this technology continues to expand as more foreign languages are added to the electronic vocabulary. There are few natural-sounding voice synthesizers on the market, however, with most synthesizers still clinging to their robotic tones.

We can look forward to higher-quality synthesizers over the next two to five years, with high-end products dropping in price as their technology is rendered less expensive by technical progress. We can also look forward to more equal opportunity among synthesizers, because the bulk of voice-output systems now use male voices. The future will offer greater opportunities to customize synthesizers, allowing the end user to choose the voice that is most pleasing for a particular application.

Multimedia will give a boost to the text-to-speech market this year, as it's applied to messaging systems, applications designed to aid the disabled, and database access over the phone. In 1993 and 1994, automobile-navigation systems will use speech to provide directions to drivers. These verbal-output systems will indicate when to turn and what routes to follow.

Speech support is being added to many platforms. Phoenix Technologies is incorporating support for Walt Disney's Sound Source digital-sampling system at the BIOS level, which will likely force other OEMs to jump on the voice bandwagon. In three to five years, voice synthesizers may appear in the form of single chips or dedicated chip sets that will allow integration of speech into everything from home appliances to workstations.

The growing applications of speech synthesis are driven by a basic force: Speech is simply one of the most powerful and natural forms of communication among humans. ■

Math-Co
Advanced Math Coprocessor
ULSI
SYSTEMS

Without ULSI Coprocessing

Not just another math coprocessor—the ULSI Math-Co™ is state-of-the-art, full double-metal CMOS 1.0μm technology. Designed with all the enhancements and performance features one would expect from leading edge silicon valley technologists, the Math-Co will increase your computing speed by up to 500%.

You can take advantage of over 2,100 different software applications designed to handle the floating point instructions necessary for screen redraws, regenerations, zooms, and other math intensive operations on 386™ computers.

Price performance leader—ULSI has incorporated in this new generation math coprocessor many performance enhancements not found in ordinary coprocessors.

- Reduced (by as much as 75%) number of clock cycles needed by the Intel 80387 to do floating-point mathematics.

- Built in automatic sleep mode to reduce battery drain in SX lap-top computers.
- Reduced power consumption, and heat radiation for the industry's best Mean Time Between Failure (MTBF) rating.
- Reduced noise sensitivity for superior hardware compatibility.

Lifetime Warranty—ULSI Math-Co's superior design allows us to offer the industries first lifetime warranty.

Wise choice—To get the finest math coprocessors available, call your local computer dealer or contact ULSI North America (512) 795-8033 or ULSI Europe 0734-462247 for the name of the dealer nearest you.

News for small computer users: Blackout protection for just \$169!

At last! A real-value Standby

BEST has made finding an SPS with real value easy. If you've made the decision that all you need is basic power protection, take a look at our new PatriotTM Standby Power System. Patriot, available in sizes from 250 to 850 VA, provides great performance at the lowest cost — just \$169!

Blackout protection on a budget

Patriot offers reliable backup power. It's a new power protection solution from Best Power Technology, Inc., the world's leading manufacturer of single-phase UPS. Patriot features: **Exceptional lightning and surge protection.** Patriot passes ANSI/IEEE C62.41 Categories A and B tests. It also passes rigorous UL 1449 tests for surge suppression — few standbys can say this.

Full-time EMI/RFI noise filtering. Patriot filters electrical noise that locks up your computer and scrambles your data.

High voltage protection. Patriot steps in to prevent high voltage from damaging your computer. No other standby offers this feature.

Output designed for computer loads. Patriot's backup power is designed for switch-mode power supplies.

Safe, assured transfer time. Patriot transfers to inverter in four milliseconds or less. A proprietary microprocessor-controlled detection system ensures quick, reliable operation that keeps your system running during a power failure.

Interface Port for LANs and multi-user systems. Patriot has an interface port (450 VA model and larger) that

Users are surprised by Patriot, BEST's new real-value Standby Power System (SPS): maximum performance at a low price!

lets it trigger an unattended, orderly shutdown on many computer systems. **Status indicator and alarms.** Patriot's two audible alarms and triple-mode status indicator light warn you of overloads and low battery runtime.

The Double Lifetime Warranty

We're so sure Patriot stops any surge that we're offering an incredible Double Lifetime Warranty! It covers our surge suppression circuitry from failure as long as you own your Patriot. If Patriot ever fails to protect the equipment plugged into it from lightning, surges, or spikes, we'll replace it and repair the protected equipment. Certain restrictions apply. Ask for details.

We're your Power PartnerTM

We've always been trendsetters in the power protection field. Now we're your total Power Partner, offering everything from advanced surge suppressors, to standby power systems, to on-line uninterruptible power systems, at prices you can afford.

Everything you need to choose the right power protection devices.

Which Patriot fits your needs?

| Patriot Model | Capacity (VA/Watts) | Runtime Full/Half Load | Dimensions (in inches) H/W/D | Weight (in lbs.) | Output | | Price |

THE ULTIMATE USER INTERFACE

Research from many fields is being synthesized
to create a design philosophy for information environments

BOB JACOBSON

The physical and symbolic worlds in which we live and work are *information environments*. In them, we find the clues and cues we use to create the multidimensional mental maps and models that help us get around and do things in the real world. An encyclopedia, a TV broadcast, and a computer are IEs that produce virtual worlds with different qualities. The IEs addressed in this article are created by a computer, alone or as part of a network.

Successful IEs express a high degree of *virtuality*: a good fit between the external worlds they are intended to represent and the virtual worlds they actually produce. Today's hypermedia and virtual reality systems are the forerunners of tomorrow's highly virtualized IEs. With the best of today's systems, people will be able to work with information naturally, manipulate data comfortably, and share knowledge easily.

Tomorrow's highly virtualized IEs will be composed of synthesized sights, sounds, and tactile fields. Their sum will far exceed their parts, because future IEs will respond to more than an inhabitant's overt commands and requests: They'll respond to his or her mood and disposition as well. In tomorrow's IEs, people will work and play smarter and better, and they will have more fun. Over time, as richer IEs appear and more people experience better-designed virtual worlds, the information age will finally become participatory.

All these predictions will be realized, however, only if IEs are well designed. To create effective IEs, designers must shift their focus from the machines that generate IEs to the virtual worlds people experience.

continued

IE Design Is the Key

Good design is conscious and systematic, part art and part science. Its rules apply equally to the design of things, places, and processes. The best designs start by considering people, not things. For IEs, this practice yields a central rule for good design: Mirror an inhabitant's internal states to most effectively get information to and from the inhabitant (see the text box "What I Look for in an Information Environment" on page 178).

"The human body is admirably equipped for deeply interactive real-time communication via sounds, and even more admirably equipped to receive all sorts of information visually," says Jim Gasperini, author of the eerily real-world computer strategy game *Hidden Agenda*. "However, when it comes to sending visual information, the unmediated body fails. When it comes to storing information, the body quickly reaches limits set by memory and mortality. The Holy Grail of interactive design is to make it intuitive—meaning that the electronic-information environment so neatly mirrors the way people imagine themselves that it seems like a direct extension of their minds."

More than acting as a temporary extension of the mind, IEs will truly extend the mind by providing a strong component of learning as a continuous part of an ongoing, multisensory interaction. Meredith Bricken builds virtual-world models for the Human Interface Technology Laboratory (also known as the HIT Lab). She advises that "designing virtual-learning environments is substantially different from both traditional-interface design and traditional-curriculum design. Because the entire person is engaged in activity, designers must work on many levels" to build

a multisensory, multimodal, personalized interface and curriculum. "The conceptual design of a virtual world defines what you do there, how you do it, what elements and behaviors you include [and exclude],

The ultimate goal in IE design is an understanding of the intended user.

and the context of the experience."

The ultimate goal in IE design is an understanding of the intended user. IEs should fit the people for whom they're intended. Designers can customize IEs so that within them inhabitants can follow their own methods to navigate, perceive, identify, evaluate, choose, modify, and share information. To do these things, designers need parameters to guide them in their work in multidimensional realms. They have to find ways to guide users through the IEs.

Navigating in Information Space

Some methods designers employ to help users navigate IEs are derived from architectural theory. Architects, like IE designers, work in space, although the space they work in obviously has a physical component and is not wholly perceptual. They depend on an architectural discipline known as *wayfinding* (i.e., knowing how to get around), which is useful for designing IEs.

Wayfinding is behavior that may be embedded in our genes. The modern practice of wayfinding, discussed by Montreal architect Romedi Passini in his book *Wayfinding in Architecture* (Van Nostrand Reinhold, 1984) and by his Toronto-based colleague Arthur Frank in *Guidebooks for Public Works Canada* (Public Works Canada, 1984–1986), is a systematic method of designing comprehensible architectural space. Environmental cues located at key decision points help a wayfarer build a mental model and find a path to his or her destination. Similar cues can be designed in IEs.

A navigator sailing from island to island, an Australian aborigine on a walkabout in the outback, and an Inuit crossing an apparently featureless white landscape

are navigating by environmental cues. The markers may not be directive; they may simply offer information that a well-educated wayfarer can use to plot a course, even in a dynamic environment. These cues may have meaning only in the context of their environment, however, so understanding how one's environment works is often crucial to finding one's way in it.

Syracuse University's Mike Nilan reinforces the need for deep knowledge: "The spatial characteristics of the IE must be structurally similar to the semantic dimensions used by the people who are trying to make sense of the problem, decision, or sought-after experience. At Syracuse, we are working on an IE for students. Its interface will be a three-dimensional map of the university that will enable students to go around the campus and get access to a variety of information and the campus computing facility."

When Navigation Doesn't Work

The navigation metaphor doesn't represent a universal solution. Psychologist Don Norman, author of *The Design of Everyday Things*, formerly titled *The Psychology of Everyday Things* (Basic Books, 1988), believes that navigation, in the sense of following a chart, "is unworkable once the size of the data set gets large." He foresees the incorporation in virtual interfaces of teleports: "I walk to the teleport and describe what I am interested in (by talking, typing, drawing, pointing, selecting—what have you), and then, whoosh, I am teleported to the place."

"The problem," says Alan Wexelblat, a virtual worlds theorist with Bull Worldwide Information Systems (Billerica, MA), "is that most information spaces have no natural order or arrangement. Architecture, CAD, and so forth—all have a natural order imposed by the 3-D geometries and laws of the physical world. But nothing like that works for the information space of all the artifacts generated in a software project (e.g., code, documentation, specifications, requests for change, requirements, and design rationale). The amount of data in such spaces is truly massive (millions to hundreds of millions of objects). Only by imposing some kind of order on it can designers possibly make it comprehensible. That is the central challenge of information-space design."

The massive complexity of information envisioned for many IEs may not be the problem it first appeared to be, because the information is in digital form. "In fact," remarks HIT Lab researcher Suzanne Weghorst, "the value of digital information is that it is mutable. You can transform it systematically or idiosyncratically, through

BYTE ACTION SUMMARY

Although the technologies for building virtual worlds are progressing rapidly, the design of the information environment that a virtual world represents will determine success. Designers are drawing on methods from a great many fields to guide their efforts to create effective IEs.

What I Look for in an Information Environment

In my meanderings around the information universe, there are few things more important to me than the quality of the virtual worlds that I build in my head, using cues from the worlds outside and what I already know. How well these mental maps and models take shape is directly attributable to the care with which various information environments (IEs) were designed.

Everyone has favorites among today's IEs (including virtual environments, The Well, Usenet, CompuServe, and even Prodigy). The best of these share characteristics that you may want to apply to future nonscreen-based IEs, such as virtual worlds:

coherence—The best IEs are clear. Their embedded meanings are, if not immediately evident, at least not cloaked. There is an internal logic to the relations within the IE and (if it aspires to represent the external world or some element of it) a reasonable correspondence between what is represented and what happens in the virtual world and what happens in the objective world.

inclusiveness—I like IEs that take me in. When I visit the Well, even though only my visual sense is stimulated (and then only by the characters on the CRT), I feel as if I'm in a living community made up of acquaintances and friends. In a state-of-the-art virtual

world, my aural machinery is also used, and the visual stimuli are fast-changing pixels that, taken together, represent for me another place entirely, with its own rules and processes. I am there, inside.

malleability—A malleable IE is one that I can sculpt to fit my own instrumental needs and aesthetic tastes—a virtual world, for example, in which I can add sound to the color of the sky, reduce gravity, or realize (a step up from visualize) a complex financial process. A hypertext database that has been thoughtfully designed can be a thing of beauty if I can easily reconfigure my progression among the records to seek knowledge in my own idiosyncratic way.

engagement—The engaging IE takes me seriously and invites my complete participation in its processes. It's a place where little time is spent carrying out bureaucratic rituals (e.g., reprogramming an arcane operating system) and plenty of time is available for exploring what is the essence of the IE—the opportunity it offers the inhabitant. And I feel very disappointed if I am asked to leave the engaging IE prematurely, before I have experienced some epiphany.

authorship—Like a signature on a lithograph or the proprietor's estate on

the label of a bottle of wine, the identity of the designers of memorable IEs is always evident. A good IE designer may leave just a vanishing trace of his or her identity before getting out of the way to allow an inhabitant to turn the world upside down, or the IE may be so stylistically strong that you meet the designer everywhere.

responsiveness—There is great pleasure to be found in IEs that acknowledge human difference and permit an inhabitant to customize the IE in his or her own image. A transaction with a bank automatic teller machine is not characterized by responsiveness. Responsiveness is exemplified by the designer of an IE who holds forth the rules by which the IE runs and then allows (or even exhorts) me to learn and change those rules. Well-designed IEs liberate their inhabitants.

purpose—There is nothing so priceless in today's time-starved world as a thing that does what it is intended to do—and does it well. Allow me to enter a virtual world that shows me what it's about, and I'm thrilled. If it's a place to poke about in and explore—a learning environment—have it say so loudly and directly. If it's where a task is to be done, have it so inform me, and let me at it. A design that dithers is unforgivable. Clarity of purpose is nirvana, in IEs as in life.

your own eyes or through the eyes of other people. Moving about in a collective world, the inhabitant can use the comparative experiences of other inhabitants as a filter: What does he see? What did she think was significant? The next step is IEs that incorporate this filtering mechanism so that copious information, far from being discouraging, becomes grist for the inhabitants' perceptual mills."

For Brenda Laurel, a principal in the IE research firm of Telepresence International (Los Gatos, CA), "the interface to a world

of information can't be about representing information; it must be about *doing* things with information, from experiencing it to more subtle goals like identifying [its author's] point of view." Laurel identifies two crucial R&D targets: creating systems that can generate multiple representations of information that are responsive to an individual's sensory characteristics, preferences, skills, and needs; and providing contexts and materials in the interface for cognitive and emotional synthesis of information, not as post hoc analytical tools

but as part of an individual's real-time process of constructing meaning.

Guides for IE Design

Just as designers borrowed architecture's concept of wayfinding, so they can borrow methods from many other fields (e.g., information-systems design, library science, and organizational theory) to design IEs that people can comfortably inhabit. *Sense-making*, an information-sciences design discipline, is one example.

In the mid-1970s, Ohio State University

WHAT MAKES SOME PRESENTATIONS MORE COMPELLING THAN OTHERS?

CAPTIVATING PRESENTATIONS ARE EASY WITH DECPRESENT FOR SUN SPARCSTATIONS.

Now your presentations can really excite your audience. All you need to turn your great ideas into compelling visuals is your Sun® SPARCstation™ and DECpresent™ software.

With DECpresent, you can build clear and attractive slides from a simple outline in minutes, mix and match slides from other presentations, and even link your slides to live data on the network. The sorter view displays your entire presentation on the screen, and speaker notes ensure that you'll make the most con-

vincing points. You'll create presentations that look like they took hours to prepare in just a few short minutes.

Call your favorite reseller listed below for our demonstration disk and see how DECpresent can make you a star.

Virtual Worlds Research Today

RICHARD HOLLOWAY

Imagine you're walking through a house—a fire crackles in the brick fireplace, an ebony grand piano plays in the living room, and glasses clink around the wooden dining room table. The images you see and the sounds you hear are quite lifelike, yet you're not actually in this house at all. You're in a virtual world.

A system developed at the University of North Carolina at Chapel Hill that allows you to walk through scenes like those I've just described consists of a VPL EyePhone for displaying the images, an optoelectronic tracker for monitoring head position and orientation, and a massively parallel graphics engine for generating the images that are displayed on the head-mounted display (HMD). Although the latter two components are unique to the UNC system, the system I've described is representative of the state of the art in virtual worlds technology.

Even though this technology may seem new, much of the virtual worlds research was inspired by Ivan Sutherland's pioneering work in the 1960s. In 1965, he postulated that "the ultimate display would, of course, be a room within which the computer could control the existence of matter. A chair displayed in such a room would be good enough to sit in. Handcuffs displayed in such a room would be confining, and a bullet displayed in such a room would be fatal."

For years, research in virtual worlds technology was pursued by a relatively small core of organizations, among them Wright-Patterson Air Force Base (and other military labs and contrac-

tors), NASA-Ames, MIT, and UNC. Recently, however, the number of researchers working in this field has skyrocketed, probably because of the technological advances in small LCD TV screens (used inside many HMDs), more powerful graphics systems, and magnetic tracking systems. These advances have increased system performance and decreased the cost of the components of a virtual worlds system to an affordable level.

Yet despite all these advances, the major technical problems that existed in the late 1960s remain with us today. Image generation of complex scenes is still quite difficult at real-time rates (around 30 frames per second). It must be possible to track at least a user's head and hand in real time and with considerable accuracy. In addition, HMDs must produce high-resolution images and wide-angle views for both eyes. And researchers still have not perfected force feedback to simulate even simple objects.

At UNC, researchers are addressing each of these issues, and they are carrying out projects for using this technology in real-world applications. Research is taking place on the visualization of protein structures, architectural building walk-throughs, radiation-treatment planning, and medical x-ray vision.

Some of the UNC system's capabilities illustrate what is possible today. In terms of image generation, the system's graphics engine (called Pixel Planes 5) can draw more than 2 million Phong-shaded z-buffered triangles per second. The ceiling system can

track a user over a 10- by 12-foot area at an average rate of 50 to 70 updates per second. The VPL EyePhone Model 2 HMD has a horizontal field of view of 80 degrees per eye and a resolution of approximately 210 by 140 full-color pixels (the newer EyePhone HRX model has roughly twice this resolution). The system provides force feedback for a user. Its Argonne Remote Manipulator can give a user feedback via three forces and three torques at the handgrip.

Current systems are often too slow and cartoonlike for a user to truly suspend disbelief. Yet each year, faster hardware and new technologies bring us closer to a system that can let users believably experience another world. In the future, faster graphics systems will allow for more complicated and realistic virtual worlds. Faster trackers will improve a system's response to user movement. Higher-resolution HMDs will display more compelling images. And force feedback will allow a user to "reach out and touch" virtual objects. Virtual worlds such as those produced by flight simulators are already convincing enough to be useful. In time, there should be virtual worlds systems that are good enough for real work in other fields (e.g., medicine and scientific visualization).

Richard Holloway is a student at UNC at Chapel Hill who works on the HMD project. His Ph.D. project is on x-ray vision for craniofacial surgery planning. You can reach him on BIX c/o "editors" or on Internet as Holloway.cs.unc.edu.

professor and communications theorist Brenda Dervin began asking her subjects the following questions: What are the problems most important to you right now? What obstacles block your way? What assistance is available to you to solve those problems? Tens of thousands of questionnaires and interviews later, Dervin and her team of researchers discovered why, in

particular situations (e.g., a person trying to get across town, a welfare mother dealing with a faceless bureaucracy, or a student looking for a citation), some people can accomplish their goals while others remain helpless and frustrated.

Making sense depends on two important ingredients: the accessibility to the person in the predicament of comprehen-

sible information, and the ability of people to conceptualize and cognitively bridge gaps in their understanding. "If you look from the inside (i.e., as the person sees the world), you find there are many ways to attain goals. The variety can be bewildering." One method of IE design is to limit goal paths to those most desirable to an inhabitant. Another is to train a person to

SIMPLICITY **SPED** SUCCESS

You're on your way with **WINDOWS** and **OS/2** Word Processing from DeScribe 3.0

Simple to use, DeScribe® Word Processor 3.0 places power at your fingertips. Let your thoughts fly because DeScribe smoothly matches your pace to help you streak across the finish line in record time.

Best of all, simplicity does not mean sacrifice. DeScribe includes all the advanced features you expect in a modern word processor and more! Like multilingual spell checking and thesaurus. Built-in definitions dictionary. Dynamic Data Exchange. Tables, drawing tools and more import filters for text and graphic formats than any other word processor on the market.

Plus, formatting is just a mouse click away with the unique Text Toolbox. Merge text and graphics. Draw lines. Be creative. Have fun. DeScribe is there to help you.

All done? Restore past work with DeScribe's unlimited UNDO. Snapshot automatically protects you from WINDOWS UAE's and those times when power goes out.

Still uncertain? Ask for a Trial Disk and take DeScribe for a test drive.

choose goal paths more wisely. A third is to propose new goals. Each method has its adherents among designers.

Sense-making's investigative methodology is also a reliable research tool that produces dependable qualitative and quantitative results. These results indicate what and how information works in a defined setting. With this tool, designers can refine IE prototypes and ensure that they accomplish the inhabitants' purpose.

From library science, designers can borrow methods found in guidebooks that spell out, in the simplest terms, how to help library patrons identify, find, and act on useful information. Organizational analysis offers some guidance for the design of multiple-inhabitant IEs, which will become increasingly common as technology develops.

Tomorrow's IEs that are built on data networks will be variegated. Many may be consensual (i.e., defined by their users). Users will enter the networked IE from many locations and situations, likely with different motives and personalities. Should we make it easy for inhabitants to hide their personalities and intentions, or should we encourage candor and direct communication? For some situations (e.g., the workplace), the networked IE will be deemed most successful when all participants share the same perceptions and meanings.

How will an appropriate group environment be designed? An understanding of group dynamics and mediated communications will help, although it may not provide all the answers. A designer may have to rely on anecdotes and metaphors for a fuller understanding of a multiple-inhabitant IE and how best to design it.

Finally, usability research is valuable for IE design. Such research can also bridge the potential gap that might otherwise separate the design of IEs from the design of their supporting platforms. Usability research, properly used, can determine the capacity of a specific system to support a desired IE. In a virtual classroom, for example, designers want an IE to be driven by a computer system that can generate a seamless visual and aural (and eventually tactile) presentation while being responsive to rapid inputs from diverse participants. The IE must provide its inhabitants with a high degree of interactivity and malleability. Usability research makes it possible to test these properties using both qualitative and quantitative indicators.

Involving the User in Design

Users should be involved in the design of IEs. "I guess I like the term *participatory*

design," says Michael Good, director of DEC's Presence project, which conducts virtual worlds research. In DEC's software usability engineering group, according to Good, users define usability, work influences user experience, and collaboration in the design process melds users and designers into a team.

The design of multiuser IEs is ultimately more complex than simply defining an en-

Designing IEs
for work today is
really engaging
in wholesale
community
reconstruction."

vironment for group interaction. Advises Charles Grantham, group-work consultant and member of the Association for Software Design, "Data becomes information when it is placed in a social context. Information technologies are coevolving with human organizations. Designing information environments for work today is really engaging in wholesale community reconstruction." Or as Marshall McLuhan so presciently said more than 25 years ago, "The medium is the message." If so, IEs should be well-designed, for their very form and construction inherently convey the worldview—the meta-message—of their designers better than the artifacts they overtly contain.

Eventually, IE design will mature from an idiosyncratic art to a craft and, perhaps, an industry. Well-designed IEs will make it easier for more people to use computers, both for traditional purposes and in new ways.

Rapidly changing technology capable of supporting highly developed IEs will spur this evolution (see the text box "Virtual Worlds Research Today" on page 180). IE design will subsume (not replace) on-screen 2-D visual graphics. Graphical interfaces, multimedia, and hypermedia (including virtual interfaces and databases) will continue to develop and eventually merge into tomorrow's IEs.

But will the new media of telecommu-

nications—especially high-speed broadband networks—deny designers ultimate control of their IEs, as technocontrarian Tom Hargadon contends? Hargadon, publisher of the multimedia newsletter *The Green Sheet*, predicts "users will complete their worlds for themselves, in whatever media they choose. [Designers and vendors] will be transmitting useful but clearly incomplete products; value will be added at many places. We are moving toward pervasiveness and completion at the end, not the beginning!" The best IEs, like the best places to live, work, and play, will be capable of being customized.

As IE platforms increase in number, decrease in size, and become less expensive, inhabitants will be able to build in multiple dimensions of sight, sound, and tactility. They will routinely generate and refine personal and collective IEs. In time, perhaps many people will fancy themselves IE designers. It's wise to remember, however, the plague of poorly designed documents that resulted from widespread desktop publishing. Although well-designed IEs will make more of us good designers, as Steve Feiner proposed, the best designers will always remain members of a select guild. It will be their responsibility to train talented aspirants so that IE design develops from an art to a craft. Will IE design finally become an industry, as has software design before it? In that case, something very dear might be lost: the designer's sensitivity to what is right.

Janey Fritsche, who codesigned the Guides project for the Apple Media Lab, implores future IE designers to know empathy: "The success of a design depends on sensory reaction, as opposed to analytical stimulation. It behooves designers to exercise artistic sensibilities that are well honed. Most of the impact of interactive multimedia and virtual reality is a 'feeling' thing. It helps to approach each project as a work of art. Just as each piece of stone speaks to the sculptor, each project speaks to the designer. Listen with the heart and be guided." ■

ACKNOWLEDGMENTS

Thanks to all who contributed, especially Craig Hubley and Scott Overmeyer for their sage thoughts and advice.

Bob Jacobson is president of Worldesign, a company that designs televirtual worlds for industrial applications. He is a research professor of landscape architecture at the University of Washington. You can contact him on BIX c/o "editors" or, as the moderator of the Usenet newsgroup sci.virtual-worlds, on Internet as @well.sf.ca.us.

INTRODUCING MICRO-CAP IV.™ MORE SPICE. MORE SPEED. MORE CIRCUIT.

PC-based circuit analysis just became faster. More powerful. And a lot easier. Because MICRO-CAP IV is here. And it continues a 12-year tradition of setting CAE price/performance standards.

Put our 386/486 MICRO-CAP IV to work, and you'll quickly streamline circuit creation, simulation and edit-simulate cycles — on circuits as large as 10,000 nodes. In fact, even our 286 version delivers a quantum leap upward in speed. Because, for one thing, MICRO-CAP IV ends SPICE-file-related slowdowns; it reads, writes and analyzes SPICE text files and MC4 schematic files. It also features fully integrated schematic and text editors. Plus an interactive graphical interface — windows, pull-down menus, mouse support, on-line HELP and documentation — that boosts speed even higher.

Now sample MICRO-CAP IV power. It comes, for example,

AC Analysis

from SPICE 2G.6 models plus extensions. Comprehensive analog behavioral modeling capabilities. A massive model library. Instant feedback plotting from real-time waveform displays. Direct schematic waveform probing. Support for both Super and Extended VGA.

And the best is still less. At \$2495, MICRO-CAP outperforms comparable PC-based analog simulators — even those \$5000+ packages — with power to spare. Further, it's available for Macintosh as well as for IBM PCs. Write or call for a brochure and demo disk. And experience firsthand added SPICE and higher speed — on larger circuits.

How Can A Direct Supplier Like Northgate® Give You Superior LAN Solutions And Support?

Like Machu Picchu, Some Phenomena May Never Be Explained.

You may think that Machu Picchu and a Northgate OmniLAN™ solution have little in common. The fact is, both are the result of insightful design and extraordinary engineering – the elements of a true phenomenon.

Whether you need a LAN with just four workstations or hun-

dreds, OmniLAN systems give you the outstanding performance and reliability you need for today's business applications. Best of all, installation is as easy as connecting the color-coded cabling and turning the system on. All networking cards and software have been installed for you. Here's how to select the right OmniLAN system for you:

Pick a file server. Options include an Elegance™ SP 386/33, SP 486™/33 or 486/33 EISA. All

have 8 or 16MB RAM, 300MB SCSI hard drive and controller, monochrome monitor and network interface card.

Choose from four topologies: ARCNET, ETHERNET Thin Net, ETHERNET 10BASE-T or Northgate Local Area Wireless Network.

Select your operating environment. Northgate has forged a strategic alliance with Novell which allows us to offer NetWare 386 3.11 and 286 2.2.

The ancient Inca ceremonial site of Machu Picchu, high up in the Peruvian Andes, has long mystified historians, scientists and engineers by the precision of its stonework. Massive granite blocks were systematically cut and set without the use of mortar – yet the joints between them are barely visible. Though they were an advanced civilization, the Incas had no iron tools or other materials to achieve this level of quality. How, then, was it accomplished? Through levitation? Psychic powers? Extra-terrestrial assistance? The answer continues to elude us.

Your network also includes four 386SX™/20 workstations each with a 52 MB hard drive, VGA card, network interface card, 14" color monitor, and OmniKey® keyboard.

You get a limited one-year parts and labor warranty including on-site service from NCR® Plus, 24-hour, 7-day-a-week toll-free technical support backed by Certified NetWare® engineers. Customized service and support plans also available.

Call for a free Decision-Maker's Kit, complete pricing and custom configuration information.

NEW LAN BACKUP TOOLS

**The BYTE Lab looks
at eight LAN tape
backup packages that
promise to keep
your files safe**

BYTE LAB STAFF

Flash! Lightning strikes a power pole near your building just as you are updating the company database. The power blinks out for a second, and the file server and some of your workstations crash. You reboot the systems, only to find your database wiped out. The immediate order of business is to repair your damaged data. First thing tomorrow, you'll investigate centralized tape backup systems for your network.

Reach Out and Touch Some Ones (and Zeros)

As we rely more and more on LANs for storing mission-critical applications and data, we've begun to take for granted that our data will always be secure, organized, and readily accessible. But backing up and managing data for an entire network is a daunting task that involves more than copying a network's worth of files onto a tape drive. Fortunately, a new generation of sophisticated LAN tape backup software promises to solve the complex problems of networkwide data backup and archiving, tape rotation, and disaster recovery. For network clients and administrators, this can mean that important data is safe even when mistakes and malfunctions threaten catastrophe.

In this Solutions Focus, the BYTE Lab evaluates eight DOS, Unix, and Mac products that treat your entire network as a collection of data to be safeguarded. Cheyenne Software's ARCserve supports workstations running DOS, Windows, or OS/2, as well as NetWare file servers. Four products—Maynard Electronics' LANStream, Mountain Network Solutions' FileSafe, Palindrome's The Network Archivist (TNA), and Performance Technology's Powersave—handle DOS workstations and file servers. Delta Microsystems' BudTool and Legato Systems' Legato NetWorker give your Unix network shared access to a single tape drive. Dantz Development's Retrospect Remote lets a single Macintosh back up both Mac file servers and clients' Macs. (See the table for a complete rundown of the features offered by these packages.)

All these products address both servers and workstations in their backup

BYTE ACTION SUMMARY

WHAT LAN TAPE BACKUP SOFTWARE DOES

With a shared high-capacity tape drive on your LAN, all clients on your office network can safely store their important files on tape.

LIKES

A shared tape drive makes it easy for system administrators to back up clients' workstations in a cost-effective manner.

DISLIKES

Setting up a LAN tape backup system can be complex at best and very aggravating to debug. Many administrators will want to call in a consultant.

RECOMMENDATIONS

The Network Archivist does a remarkable job of automating NetWare backups; ARCserve and LANStream are good alternatives. Legato NetWorker is our choice for powerful yet easy-to-use Unix network backups. Retrospect Remote is an excellent Macintosh backup package.

schemes. We chose systems capable of sorting 1 gigabyte or more of data, a threshold for performing an unattended backup of an entire network (for a discussion of tape drives with more than 1 gigabyte of storage, see the text box "Life Above 1 Gigabyte: DAT vs. 8-mm vs. QIC" on page 197). Our test sample consisted of stand-alone software and software/hardware bundles. In some cases, drive vendors repackage third-party software with only minor alterations. We didn't test the variations, but let the original software represent the group.

Network Concerns

Besides safeguarding data with regular backup schemes, these products attempt to solve problems vital to networks. For example, you should devise a workable tape-rotation scheme so that the loss of a single tape is not a catastrophe. Backup software with integrated schedulers can help. Software can also perform incremental backups, copying only the files that have changed since the last backup. A good rotation scheme will include a regular schedule of full and incremental backups. In one instance, the software can fully automate the rotation process.

What if you need an earlier version of a particular file? A documented catalog of your tapes, together with ample notes,

LAN BACKUP SOFTWARE

The new generation of LAN tape backup software takes some of the drudgery out of administrative chores such as scheduling, file migration, and tape rotation. (● = yes; ○ = no; N/A = not applicable.)

¹ Prices include software and hardware.

² Prices include device drivers but no hardware.

will enable you to restore older versions of important files. Alternatively, backup software can keep track of file histories for you, listing the version dates and prompting for the correct tape when a specific version is restored.

A good backup strategy will also address the thorny problem of disk space on the server. Unused files should be shuffled off to tape and removed from the server altogether. In some cases, a zero-length file will remain on-line so that if the file is called, the backup software will restore the original file from tape and deliver it to the application. The trend is toward tiered storage, where files migrate first to a large-volume on-line storage medium such as read/write optical before being archived to tape.

And what about the workstations on your network? More often than not, local stations will not have the resources avail-

able to maintain a regular schedule of disk backup. So what happens to all that vulnerable data? Until recently, you had to resort to third-party peer-to-peer networking extensions to make other workstations accessible to a single tape drive. Older backup software isn't always network-aware, but as long as it thinks that a drive is local, it will dutifully save its contents to tape. Anyway, clients no longer store valuable data on their hard drives—it's all on the server, right?

Not necessarily. Windows and Mac applications tend to be huge nowadays, and to speed up network operations, most clients keep their applications and data on local hard drives. While the mission-critical shared database information is probably on the server, there's likely to be more and more valuable stuff on individual workstations. Distributing data throughout the network is common in

Unix installations. That's where the new crop of tape backup software comes in—it can reach through the wires and grab data from anywhere for safekeeping.

Most versions of Unix include a set of commands that handle file backup and restore operations. Despite the cost benefits, however, the standard Unix backup utilities provide only the most primitive capabilities; some even lack the ability to span multiple tapes. Berkeley Standard Distribution flavors of Unix, and those that borrow from BSD, add access to remote tape drives through the network. Again, this facility is primitive, and performance is far from optimal.

Besides using different rotation plans and having very different user interfaces, these systems exhibit substantial differences in backup topologies. FileSafe, TNA, Powersave, and Retrospect Remote put the tape drive on one worksta-

workstations, and an assortment of 4- and 8-mm helical-scan tape drives. Some drives came with their own proprietary SCSI controllers and drivers; others supported an Adaptec 1522 SCSI controller.

We tested the two Unix packages on an isolated network that included an Opus System 5000 SPARC workstation, an Altos System 5000 486/33 file server, and several DOS systems. We set up the Opus as the backup server using its 150-MB internal quarter-inch cartridge (QIC) tape drive as the backup device.

Retrospect Remote ran on our Macintosh AppleShare network with a mixture of AppleShare and NetWare for Macintosh AFP-compliant servers. As workstations, we used a Mac IIcx connected to an Irwin 5080 cartridge tape drive, an Archive Python 2-gigabyte digital audio-tape (DAT) drive, and an Iomega Bernoulli 90 removable cartridge drive. The clients were a Mac IIci and a Quadra 900 running System 7.0, and a Mac II with a Radius Rocket running System 6.0.5.

Testing software designed to recover from catastrophic events is a complex task. We had to simulate weeks of normal use and then create a disaster. For each package, we formatted a set of tapes and backed up the network repeatedly to test the rotation and tape overflow features. To get a feel for recovery mechanisms, we occasionally deleted directories and restored them from tape. When a package used the network storage for its own database (rather than storing it on tape), we damaged the database to see how well the software handled it.

Given so many different architectures and tape drives, we could not make objective performance comparisons. Performance on your network will depend on the particular tape drive, the network transport layer, and the I/O performance of your tape drive and interface.

ARCserve 4.0

Of the DOS packages, Cheyenne Software's ARCserve had our favorite topology: The tape drive attaches to the file server, and the system administrator establishes backup queues much like NetWare print queues. Any client with access rights can then post a backup request to the server.

ARCserve looks exactly like any other NetWare utility (see screen 1). To place a backup job in the server queue, you select a queue from a pick list and press the Insert key. A window then pops up displaying the Unattended Operations menu. You select a function and choose a predefined script or make up a new one. The job will execute at the time you specify, whether you're logged in or not. The server knows enough to prompt you for a particular tape if you've specified one by name. You make your workstation accessible by running one of three TSR programs: DOSAGENT publishes your workstation by node address and makes your files available over the Novell IPX/SPX transport layer; WINAGENT does the same for workstations running Windows; and OS2AGENT is a background process for OS/2.

ARCserve uses a grandfather-father-son tape rotation scheme. This is perhaps the most common method for desktop computers and one that works well if you're diligent about keeping track of which tapes are which. Basically, you start with a full-system backup on a given day of the week. For the rest of the week, you perform incremental backups (i.e., backing up only new or changed files), preferably on a new tape each day. On full-backup day next week, you use a fresh tape to do another full backup. The full backup from the previous week

tion—most likely the system administrator's. That workstation runs a stand-alone application that accesses the file servers and other workstations (see part a of the figure). LANStream requires you to designate a workstation as a dedicated backup server. ARCserve treats the tape drive as a shared resource (see part b of the figure) and puts the drive on one of the system's NetWare servers. The administrator grants access to a backup queue, and clients post requests to the server. BudTool and Legato NetWorker use Unix's multitasking capabilities to turn one of the networked workstations into a nondedicated tape server.

Test-Beds

We installed each package on one of three test-beds. Our NetWare test-bed consisted of a 486/33 file server running NetWare 3.11, Dell and Tangent 386/25

TWO TAPE DRIVE STRATEGIES

(a) Most centralized LAN backup systems place the tape drive on an administrator's workstation. On demand or on schedule, the backup software reaches out through the network and grabs files from the servers and other workstations. Workstations have to "publish" their local drives to make them look like file servers.

(b) A shared tape drive is a resource, just as a printer or a high-speed modem can be. In some installations, putting the tape drive on the file server makes sense. Unlike an administrator's workstation, the file server rarely gets turned off, making it ideal for backup service. Another benefit is that, to back up the server data, the files don't have to be shuffled over the network.

becomes an archive tape or is put into a 4- to 6-week rotation, depending on your needs.

At any given time, you can bring the system to a known state by restoring the last full backup and all the incrementals. ARCserve automatically handles the rotation by giving each day's tape a different name and making the right kind of backup (i.e., either full or incremental). It's still your responsibility to manage the sets of tapes.

ARCserve for NetWare 3.11 installs as a NetWare loadable module. You simply log into the server as SUPERVISOR, run a simple installation package, and then load the NLM from the server console. You specify ARCserve queues with a given user list and priority. Tape operations can be either attended or unattended. Attended backups happen on-screen while you wait. If the tape driver is busy, you get a message on-screen, and you're asked to try again later. Unattended backups go into a backup queue and get processed later at a time you specify.

We tested ARCserve with two Python 2-gigabyte 4-mm DAT drives connected to a single Adaptec controller. ARCserve queues aren't specific to a given drive; selecting the right drive on the SCSI bus is left to the ARCserve SCSI driver, which scans the tape labels looking for a match. If it can't find one, you get a Net-

Ware message at the bottom of your screen asking for a new tape. We had no difficulty getting ARCserve running after we updated the IPX shell to the latest version (3.10), but the constant stream of NetWare SEND messages got to be a bit annoying.

FileSafe 5.2.2A

Mountain Network Solutions' FileSafe provides two distinct user interfaces. A menued interface packs all the major functions of the software into an easy-to-use shell. Command-line utilities give you the same power through customized batch files.

The menued interface follows a hierarchical structure. The first screen presents the basic operations: backing up, restoring, and verifying. When you choose an option, such as Backup, from the main menu screen, a second screen appears with a menu offering the choice of Full, Selective, or Automatic backup. Should you choose to do a selective backup or restore, you are then presented with a list of drives, directories, and files to pick from. You can then tag the files you want to operate on. At this point, you can call an Include or Exclude box and use DOS wild cards to select or filter out specific sets of files. You can also restrict

the backup to a specified range of dates, or you can back up only files created or modified since your last tape backup.

The Automatic menu option lets you schedule recurring jobs. You select the days of the week when you want the backup to run, the time to run the job, and the interval between jobs. You can then run a job every week on the specified day or at any set interval (e.g., every 2 hours).

According to Mountain Network Solutions, the tape drive has Quick File Access capability. QFA uses block addresses to locate data instead of sequentially reading through files. This feature did not appear to be operational in our setup. The drive seemed to read through the tape, trying to locate the files. At one point, the software took forever to display the directory structure of a selected drive. With the directory on-screen, we called for a backup but forgot to designate specific files. The software told us that no files had been selected. FileSafe had to search through the tape again to redisplay the directory.

FileSafe includes a full set of programs invoked from the DOS prompt. It also has a TSR scheduler that will fire off any command at an appointed time. If your system is busy at the appointed time, you can tell the scheduler to wait until the system is idle, or you can have the scheduler preempt a running program. We found the scheduler to be a bit

Life Above 1 Gigabyte: DAT vs. 8-mm vs. QIC

Roger C. Alford

Three primary tape-drive technologies are available that can accommodate the high-capacity storage requirements of modern LANs: digital audiotape (DAT), 8-mm tape, and quarter-inch cartridge (QIC). These alternatives offer trade-offs in capacity, speed, size, backward compatibility, and price, so you must choose the right platform based on your specific requirements.

Basic Technologies

Long popular for lower-capacity backup, QIC drives have recently reached into the 1-gigabyte-plus capacities. The QIC-1000 drives introduced last year support 1 gigabyte of data storage on a single DC6000 cartridge, and the newer QIC-1350 drives appearing this year tout a 1.35-gigabyte capacity.

DAT has been establishing itself for data backup since its introduction to the audio market in 1986. The DAT drive market has standardized on two incompatible data formats: DDS (digital data storage) and Data/DAT. DDS has achieved the greatest industry acceptance, and it is used by most current DAT drives. Data/DAT is somewhat slower than DDS but allows block and sector updating and high-speed file searches.

There are now numerous DAT drive manufacturers, including many of the established QIC drive producers. DAT drives offer 1.3 gigabytes of storage on a standard 60-meter data cartridge, and 2 gigabytes on the longer 90-meter cartridge. DAT cartridges use a 4-mm-wide metal-particle medium, and, at under 1/2-inch thick and smaller than a business card, the package is the smallest of the high-capacity data cartridges.

Eight-millimeter drives, introduced by Exabyte in 1987, are based on VCR technology. Exabyte remains the sole manufacturer of these drives, although many companies private-label the Exa-

byte drive. These drives use a data cartridge about the size of a deck of cards, incorporating an 8-mm-wide metal-particle medium. The 8-mm drives are available in 2.5- and 5.0-gigabyte capacities. The ISO recently voted to standardize Exabyte's 8-mm tape format.

Drive Comparisons

All the drives incorporate read-after-write data verification to ensure data integrity and use embedded error-correction codes to recover data if any data becomes corrupted. Most implementations of these high-capacity tape drives use the popular SCSI connection. While DAT drives are commonly available in a 3 1/2-inch half-height form factor, QIC-1000/-1350 drives generally maintain a 5 1/4-inch half-height profile. The 8-mm drives have been traditionally packaged in a 5 1/4-inch full-height form factor, although newer half-height models are now available.

QIC standards allow the 1-gigabyte-plus drives to read tapes from lower-capacity drives (e.g., the popular 525-MB QIC drives) and permit interchange of tapes produced by different drive manufacturers. The established DDS standard also allows data cartridge interchangeability among the DAT drive manufacturers, but as I've mentioned, the DDS and Data/DAT formats are not interchangeable. Since Exabyte is the sole 8-mm drive manufacturer, com-

patibility is not an issue.

The different drive types vary in speed. QIC-1000 drives can transfer data at 200 KBps, while QIC-1350 drives offer transfer rates of up to 600 KBps. DAT drives transfer data at a slower 180 KBps. Finally, 2.5-gigabyte 8-mm drives transfer data at 246 KBps, and their 5-gigabyte big brother touts a 500-KBps data transfer rate. Data compression, now used almost universally by tape drive manufacturers, effectively increases these data transfer

rates as well as data storage capacities.

Cost is always an important issue. It's likely that QIC drives will maintain the lowest price tag of the high-capacity alternatives, but DAT price drops this past year promise to give QIC some competition. QIC-1000/-1350 drives typically cost between \$2000 and \$4000, while typical DAT prices range between \$2500 and \$6000; recent DAT drives, however, have sold for as little as \$1500. The capacity-king 8-mm drives will probably remain the premium backup alternative for the foreseeable future, generally costing well over \$5000 for a 2.5-gigabyte model and over \$10,000 for a 5-gigabyte unit. Media costs for all the drives are similar, at between \$20 and \$40 per cartridge.

Future capacity increases for the competing tape drive technologies are unclear. Current QIC plans call for capacity increases to 35 gigabytes within five years. DAT will probably reach 5 gigabytes within the next two years but may not go much higher. Similarly, Exabyte is expected to introduce a drive with an 8- to 10-gigabyte capacity within the next two years, but further capacity increases may be slow in coming.

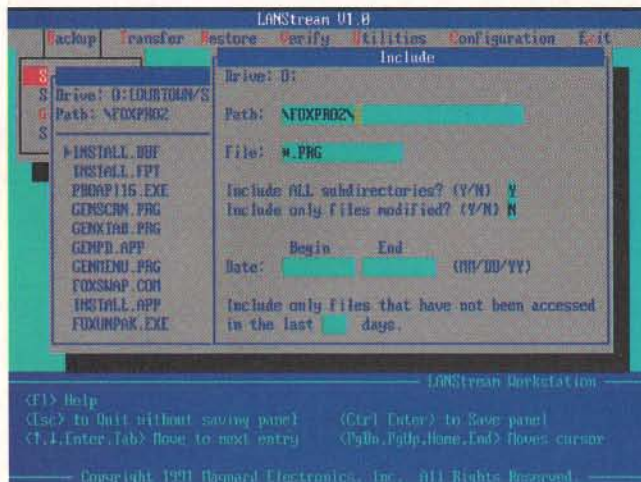

Roger C. Alford, a BYTE consulting editor, is president of Programmable Devices, a Michigan-based electronics design firm. He can be reached on BIX as "rogera."

limited and unreliable. The preempting feature will not work in graphics mode or if your program is making DOS calls or accessing the hard disk.

If you prefer, you can set up batch files to automatically perform your backup chores. This takes some knowledge of DOS batch files, but Mountain offers help both in the documentation and by providing useful samples on disk. Mountain's standard `bkall` batch file does a full backup of all workstations. We added just a few lines and included full backups of all the file servers as well.

The FileTalk software provides a solution for backing up local workstation disks across the network (based on the Pipes peer-to-peer kernel). Published drives appear across the network with a user prefix (e.g., `BILL:C:`). You can back up any published drive from the administrator's station as if the disk were local.

We found FileSafe to be reliable and solid, if a bit slow and unresponsive at times. It will do the main job of LAN backup, but it can't help you with scheduling, tape rotation, file grooming, and other advanced administrative tasks.

Screen 2:
The LANStream interface lets you select files from a directory tree. From pop-up boxes, you can exclude or include sets of files using DOS wild cards and other filters such as date stamps and NetWare's last-access flag.

LANStream 1.0

In automating your backup chores, Maynard Electronics' LANStream doesn't go as far as TNA (see below), but it stakes out a solid middle ground. For instance, LANStream has no rotation software of its own but prompts you for new tapes as needed. You can schedule rotation for an

interval of your choosing, and at the appointed time the system asks you for a new tape. LANStream opts for a simple and effective approach, sacrificing some power along the way.

That's not to say that LANStream is a bare-bones offering. Far from it. The software treats tape drives as shared devices so that each workstation can access the drive and schedule a wide assortment

DATA COMPRESSION LIBRARIES™

PKWARE's® Data Compression Libraries™ allow software developers to add data compression technology to software applications. The application program controls all the input and output of data allowing data to be compressed or extracted to or from any device or area of memory.

- All Purpose Data Compression Algorithm Compresses Ascii or Binary Data Quickly with similar compression achieved by the popular **PKZIP** software, however the format used by the compression routine is completely generic and not specific to the PKZIP file format.
- Application Controlled I/O and memory allocation for extreme flexibility.
- Adjustable Dictionary Size allows software to be fine tuned for Maximum Size or Speed.
- Approximately 35K memory needed for Compression, 12K memory needed for Extraction.
- Compatible with most popular Languages: C, C++ , Pascal, Assembly, Basic, Clipper, Etc.
- Works with any 80x86 family CPU in real or protected mode. \$295.00
- No runtime royalties.

RUNNING OUT OF EXPENSIVE DISK SPACE?

PKZIP can help! **PKZIP** compresses your files to free up disk space and reduce modem transfer time. You can compress a single file or entire directory structures with a single command. Compressed files can be quickly returned to their normal size with **PKUNZIP**.

Software developers can reduce the number of diskettes needed to distribute their product by using **PKZIP**. Call for Distribution License information.

See us at Comdex, Booth #862

The included **PKZIP** utility lets you store compressed files as a single self-extracting .EXE files that automatically uncompresses when run. Only \$47.00

V E R B A T I M[®]

of jobs. One workstation on the network becomes a dedicated tape server. Ideally, you'd run the server software at the end of the day and schedule your tape backup jobs after hours. Another approach might be to set up a system and dedicate it to running the LANStream server software. You can perform certain administrative tasks from the tape server, but the bulk of the work—backup, restores, transfers, and scheduling—would be performed by the LANStream workstations.

To manage data on the network, LAN-Stream employs NetWare's Btrieve. (You'll need Btrieve 5.16 or higher to get up and running.) We had to acquire an update patch, and even then the NLM reported some intermittent errors. Each client on the network who wants to access the tape server must install a copy of the workstation software. The software assigns the NetWare log-in name to the installed workstation, so if you have people sharing a single workstation, they have to share a single NetWare account.

Once the software is installed, the workstations can tap the tape drive as a shared resource. Each workstation's capabilities are limited by a combination of the user's NetWare and LANStream privileges. From the workstations, users can back up mapped NetWare drives as well as their local drives. They can also run a TSR (i.e., IsleLAN) and publish their local drives for other workstations on the network.

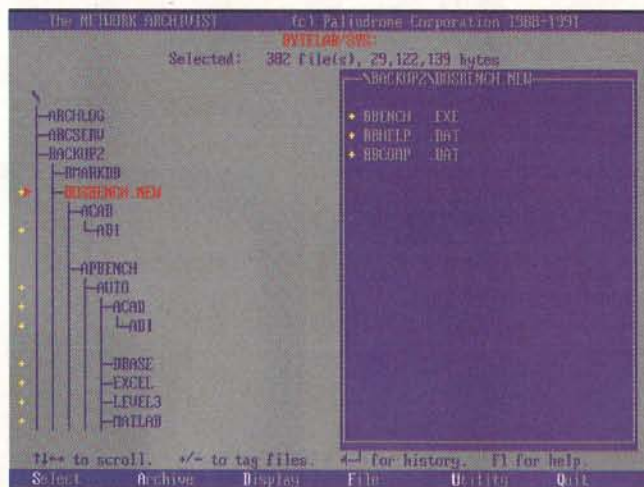

The software presents an easy-to-use menued interface. From the workstation, three basic tasks are available: backup, restore, and transfer; each task has a pull-down menu associated with it. To perform an operation, you choose the appropriate menu and select the files you want to work with. You can select entire drives, a range of subdirectories, or individual files. Files can be included or excluded by wild-card designators or date ranges (see screen 2). By selecting the Transfer operation, you can perform selective file "grooming" by transferring only those files not accessed in, say, 180 days (you can select any period up to 999 days). The files selected would then be copied to the tape drive and removed from the network drive.

LANStream makes it easy to create scripts. You simply select the operation you want scripted, designate the files to be included in the operation, and then select a menu option to save the script. The integrated scheduler lets you set up jobs to run at a particular day and time or at any interval you designate.

LANStream also supports multiple

drives on the tape server. Each tape drive can be limited to a particular group of users (e.g., a department) or even to different operations (e.g., a tape drive could be set up for restore jobs only). This type of flexibility is LANStream's greatest strength. If you want a single administrator to be in charge of backup operations, that's no problem; users can simply publish their drives. On the other hand, you

can off-load some of the administrator's responsibilities by leaving it up to the users to back up their own local drives while the administrator backs up the network. It's a nice compromise between the fully automated TNA approach and the traditional manual approach. You have the tools to do what you want, but it's still up to you to set up an efficient backup strategy.

Screen 3:
For manually archiving files onto tape, The Network Archivist provides an easy, point-and-shoot menu system. Automatic operations take care of themselves.

The Network Archivist 2.0

Palindrome's TNA (see screen 3) is easily the most ambitious of the backup packages we looked at. It doesn't treat your backups as a series of tapes, but rather as a vast collection of data that just happens to be scattered among a series of tape sets. In short, you don't use TNA to copy data onto tapes, but to manage your files, and you trust it to handle the tapes any way it wants.

The way the package likes to work is through fully automatic tape rotation using a Tower of Hanoi algorithm. Popular among the minicomputer and mainframe crowd, this algorithm chooses among five or seven tape sets, depending on the parameters you select. This scheme improves on the standard father-son algorithm by making more versions of your data available with less tape and less backup time.

You start by doing a full backup to one tape set—call it A. The next day's tape will be B, and so on until you get to G. The rotation scheme calls for G to be updated every 2 days, F every 4 days, E every 8 days, and then back to A and B, which each get updated every 16 days. The algorithm gets its name from the children's game that uses a stack of dif-

ferent-size disks and three poles. The idea is to transfer the entire stack of disks from one pole to another by moving one disk at a time and always placing a smaller disk on a larger one. For every disk (i.e., backup tape) you add, the number of moves (i.e., backups per rotation) will double.

To save on the amount of data written to tape, TNA considers that any data that has been stored onto three tapes without being changed is *saved* and that data won't be written to tape again. The software tracks the file's access history and, once it becomes stable, makes sure that it resides permanently on three tapes. Some time later (12 weeks by default), the file becomes eligible for migration or grooming. At the administrator's discretion, eligible files can be identified and purged from the file server. The file will be replaced with a zero-length phantom file and flagged in TNA's database. If your PC then tries to access the file, TNAFNTOM (a DOS TSR) will trap the access and tell you that the file has migrated to tape.

For workstation backup, TNA uses a pair of TSRs, TNAWS and TNACNTRL, based on Fresh Technology's Map Assist, a NetWare peer-to-peer networking package. TNAWS makes your workstation's drives available to other workstations, and TNACNTRL lets the backup

Buy with

Confidence

In an effort to make your telephone purchasing a more successful and pleasurable activity, The Microcomputer Marketing Council of the Direct Marketing Association, Inc. offers this advice, "A knowledgeable buyer will be a successful buyer." These are specific facts you should know about the prospective seller before placing an order:

Ask These Important Questions

- How long has the company been in business?
- Does the company offer technical assistance?
- Is there a service facility?
- Are manufacturer's warranties handled through the company?
- Does the seller have formal return and refund policies?
- Is there an additional charge for use of credit cards?
- Are credit card charges held until time of shipment?
- What are shipping costs for items ordered?

Reputable computer dealers will answer all these questions to your satisfaction. Don't settle for less when buying your computer hardware, software, peripherals and supplies.

Purchasing Guidelines

- State as completely and accurately as you can what merchandise you want including brand name, model number, catalog number.
- Establish that the item is in stock and confirm shipping date.
- Confirm that the price is as advertised.
- Obtain an order number and identification of the sales representative.
- Make a record of your order, noting exact price including shipping, date of order, promised shipping date and order number.

If you ever have a problem, remember to deal first with the seller. If you cannot resolve the problem, write to MAIL ORDER ACTION LINE, c/o DMA, 6 E. 43rd St., New York, NY 10017.

This message is brought to you by:

the MICROCOMPUTER
MARKETING COUNCIL

workstation see the mapped drives as local. Straight out of the box, TNA will manage up to 350 MB of data per network. As your network grows, you can add more coverage with extension disks: The first boosts TNA's capacity to 1.3 gigabytes; the second gives you the ability to manage unlimited amounts of data.

Our only reservation about TNA is that it may be *too* automatic. Tape backup should be a system administrator's responsibility. If a file server crashes and needs to be restored, it's the administrator's responsibility to restore the right files from the right tape. TNA follows a complicated algorithm and makes a number of decisions on its own without any human input. With the disk database destroyed, TNA needs you to insert the correct tape to rebuild it, and it won't know which tape it wants. If you haven't been paying attention to the rotations, you may not know, either. Tape recovery works well. The only way we found to confuse it horribly was to manually scramble its disk database.

If you wind up using TNA, we suggest you keep a small calendar nearby and jot down the tape-set ID it asks for each day. That way, if a catastrophic event occurs, you won't have to guess which tape is which and possibly restore old files by mistake. TNA's attention to data security makes it a superb choice for most LANs. Just remember—it's *your* data, and ultimately you have to take responsibility for protecting it. TNA will do the hard part; all you have to do is watch and pay attention.

Powersave 2.2

Offering a well-organized menu-driven interface, Performance Technology's Powersave is easy to install and use. Unfortunately, the software pales in comparison to the new breed of automated, full-featured programs such as ARCserve, LANStream, and TNA.

The utility menu offers basic options, including save, restore, and utility selections. From the save menu, you can select an entire network or pick specific sub-directories and files. The interface includes smooth mouse support for triggering menu options and selecting drives or files. It also features sliding bars to indicate the progress of backup and restore operations—handy when you're waiting for long jobs to finish.

The utility menu option lets you check a tape's contents or perform diagnostics and maintenance tasks. From this op-

tion, you can also create automated scripts. The software creates a batch file and a data file containing control instructions passed to the batch file. You can then conduct an unattended backup session by running the batch file. The batch file performs the backup by using a command-line version of the software along with the parameters supplied by the data file. A "wait" option will hold the backup job until a specified time.

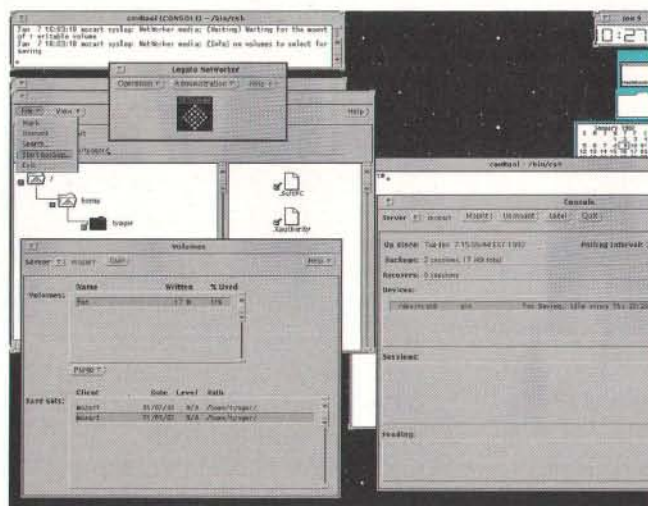

Powersave provides some of the sophisticated features of the more advanced packages, but they are not implemented in a very sophisticated way. For instance, background scheduling is offered via a bundled TSR that will run any DOS batch file at a specified time. The program simply squirts out the character string needed to start the batch file at the appointed time. As long as you are sitting at an inactive DOS prompt, it works fine. When we were in an application, however, the character string was simply fed to the application.

The solution for backing up workstations on the network also falls short.

Each workstation has to run an access application, becoming in effect a temporary file server. While it is waiting to be backed up, the workstation cannot run any other application software. Workstation backups proceeded without a hitch, but other solutions offered in this review work as well without tying up all the resources of the workstation.

We also had some reliability problems with the software. When our backup job required a second tape, Powersave ejected the first tape and then refused to accept a new one. We were unable to recover data from the first tape. We also had some problems running the software with a supported 8-mm tape drive. Technical support, although helpful, was unable to re-create the problem.

Powersave works well as a simple utility for backing up local and network drives. It's quite fast and very easy to use. However, if you want the advanced features of today's more sophisticated LAN backup software—scheduling, tape rotation, and grooming—you'll have to look elsewhere.

Screen 4: NetWorker's GUI includes a graphical file-selection window and a console screen that constantly reports the status of the backup server.

Legato NetWorker 3.0

Legato Systems' NetWorker is an elegant solution to a very complex problem. Its emphasis is on automating the organization that's needed to manage backups, particularly for large networks of systems. It's appropriate, therefore, that NetWorker calls on you to do a small amount of advance setup. It ships with a reasonable set of defaults, but it clearly works best when you lay out a backup strategy in advance and use NetWorker's facilities to manage that strategy for you.

The basic plan is this: You create a library of tapes (NetWorker handles QIC, 8-mm, 4-mm, and reel-to-reel tape) and mark each tape with two labels: one that you write on the outside, and one that NetWorker encodes both on the medium itself and in an index file on the backup server's disk. Backups can be kicked off automatically by NetWorker, based on a schedule that can be applied systemwide, on a per-system level, or to a group of related systems. Systems that are running the Legato client software can also request backups and restores through the network.

Because Legato NetWorker maintains

#1 Text Retrieval Software

"Powerful and flexible search capabilities; extremely easy to learn and use."

—Patrick Marshall

InfoWorld, August 5, 1991

Finds needed information quickly.

ZyINDEX simultaneously searches all files, thousands of pages, entire networks, with results in less than 3 seconds!

Searching is easy. To find a word, just type it. Instructions are clear and readily available.

Versatile. Powerful. ZyINDEX provides the widest range of search techniques:

- Boolean Logic • Thesaurus
- Comments • Phrase Searches
- Numeric Range • Field Searches
- Wildcards • Conceptual Searches
- Proximity Searches... and more.

Prepare your entire drive for searching with just one keystroke. Ideally suited for networks and frequently changing text.

ZyINDEX finds every occurrence of your search request.

- Select any file for viewing.
- Browse or jump from hit to hit.
- Copy, paste and print.

Available for DOS, Windows and UNIX. Supports WordPerfect, Word and most other word processor formats.

a detailed index on the server's disk (an index that can be restored in the event of a server failure), a restore request can be filled quickly; a message appears on the server's console instructing the operator to insert the appropriate tape. NetWorker's index files can also be queried. If your archives contain several versions of a single file, for example, the index will let you restore any one of them.

As we said, NetWorker is plainly built with large networks in mind. It eases the

management of multiple servers, multiple backup devices per server, multiple simultaneous client requests, and so on. Because NetWorker writes label data onto each tape, the common error of inserting the wrong tape or writing over an old volume is minimized. Finally, Legato's documentation includes an extensive tutorial on planning backup strategies.

NetWorker is actually a set of Unix command-line utilities that act together to handle backups and restores, tape li-

brary management, data compression, and other functions. On the Sun/SPARC version, a very effective Open Look interface is included that ties the utilities together (see screen 4).

NetWorker uses a proprietary scheme for writing the data to tape and will apply compression at your discretion. In our tests, compression seemed to work very effectively, reducing a 30-MB test backup tree to a reported 8.6 MB on tape. This surprisingly high compression ratio was partly due to a high percentage of source code files in the test tree, but Legato still deserves credit for such an effective compression scheme. It took 6 minutes to write the compressed 30 MB to tape; that's a solid 5 MB per minute, but compression played a role in that, as well.

NetWorker's interface is impressive. It's very easy to learn and use, and the file-selection mechanism (invoked by clients posting a backup request to the server) is easy enough for even the most inexperienced users to understand.

PORTABLE COMPATIBLE INCREDIBLE

PARALLEL STREAM II

A new generation of portable tape backup systems

PORTABLE: The Parallel Stream II is a unique lightweight portable tape backup system with a handle...which makes it easy to move from computer to computer. This effortless sharing is possible because the Parallel Stream II does not require the installation of a dedicated controller board, has no jumpers or switch settings, and no complicated installation or setup procedure.

COMPATIBLE: The Parallel Stream II is a total backup solution offering complete compatibility with both IBM and Apple Macintosh architectures. The Parallel Stream II can also be utilized by many popular third party backup utility software packages.

INCREDIBLE: The Parallel Stream II is available in two (2) capacities; 250MB & 525MB and has the flexibility of interfacing directly via a parallel port at up to 5MB per minute and through a SCSI port at 6-12MB per minute. The Parallel Stream II is not only easy to use, but it's the most cost effective tape backup solution available. It also comes with a 30 day unconditional guaranty.

BudTool 4.0

Delta Microsystems' BudTool 4.0 is a step away from the self-contained, proprietary approach of Legato NetWorker. BudTool is a set of programs and user-interface elements that form wrappers around existing Unix backup utilities like tar, dump, and cpio. What's more, while NetWorker's emphasis is on tight control and ease of use, BudTool appeals more to experienced Unix system administrators.

Many elements of BudTool are similar to those of NetWorker. BudTool maintains server-based databases of tapes and schedules and can handle both automated and manual backup requests. Also similar is the way in which clients can post backup requests through the network. In fact, both packages serve roughly the same purpose and offer roughly the same set of capabilities. There are, however, some important differences.

Because BudTool uses standard Unix commands, the data on the backup tape can be read by any system, even one without BudTool. The converse is not true, however; you can use BudTool only to manage BudTool tapes, because of the required label file placed at the front of each tape.

While portability can be seen as an advantage, it carries all the disadvantages of whichever Unix program is chosen to handle the transfer. Some are slow,

others can't span multiple tapes, and all lack the ability to compress data. While some administrators prefer to do without it, we can't imagine backing up a large network without data compression; it seems like a waste of expensive tape. To its credit, Delta Microsystems does include an option for creating a custom backup/restore command. You can specify a pipe sequence that includes compression and decompression.

BudTool's interface is somewhat sparse compared to Legato NetWorker's, but it seems to cover all the bases. The file-selection dialog box isn't as elegant, either, but the basic ability to mouse around to select files is supported.

Overall, BudTool is an extensible set of network backup tools for advanced system administrators. The back of the manual lists the formats for all the internal files used by BudTool's various modules and also includes a description of a language used to generate tape labels from symbolic expressions. This is an incredibly versatile foundation for a network backup system, but its best audience is those who are prepared to invest a lot of time in tuning and configuration.

Screen 5: Retrospect's Browser window is the heart and soul of the package. This is the default view of a single drive, but you can select from a number of views depending on the level of detail you need.

Retrospect Remote 1.3

The regular version of Dantz Development's Retrospect, which supports many different kinds of tape drives, is included with a number of tape drives and Iomega's Bernoulli 90 removable cartridge drive. Retrospect Remote is simply an

extension that gives the program access to workstation disk drives.

After an easy installation, you fire up the application on the backup Mac and choose "Remotes" from the configuration menu. Retrospect looks out on the network and gives you a list of all the machines (by name) that are currently running the Remote INIT. You activate each workstation by assigning it a unique ID

"... **ISYS** replaces ZyINDEX for DOS as the industry standard for unstructured DOS text retrieval programs."[†] PC Sources 11/91

Text retrieval faster than a speeding bullet...

Usually, the time you want to find information most is when you're in the middle of something. Without exiting your work, pop up ISYS, get what you need, then copy and paste it into whatever you're working on!

Don't take our word for it. PC Week, May 1991, rated ISYS tops in flexibility and functionality, as well as file compatibility and quality of documentation.*

\$99 TRADE-IN OFFER: Send us your ZyINDEX disk and receive your ISYS replacement by return mail. \$395 value.

HOW DO YOU GET A JOB WITHOUT EXPERIENCE? AND HOW DO YOU GET EXPERIENCE WITHOUT A JOB?

Most young people have one answer to this problem. They avoid it until they're out of college. But they could be getting solid work experience while they're still in college. With your company's help. And ours.

We're Co-op Education. A nationwide program that helps college students get real jobs for real pay, while they're getting an education.

But we can't do it without you.

Those real jobs have to come from real companies. Like yours.

For more information on how you can participate in this valuable program, write Co-op Education, Box 775E, Boston, MA 02115.

Not only will you be giving students a chance to earn money and pick up the most valuable kind of knowledge, you'll be giving yourselves a chance to pick up the most valuable kind of employee.

Co-op Education.

You earn a future when you earn a degree.

A Public Service of This Publication ©1987 National Commission for Cooperative Education

number (three come with the package; you buy extra ID numbers up to a total of 2400). Once you assign an administrator's password to the backup workstation, your network is secure. If you like, you can have Retrospect encrypt the data moving over the network so that AppleTalk packet sniffers can't see anything recognizable.

The interface is all Macintosh. Protected volumes appear by name and icon, and workstations, local hard drives, and file servers all appear interchangeably. To access specific files on a volume, you just click on the volume and bring up a Browser window (see screen 5). Each file and folder appear in hierarchical order, with a very nice thumbnail on the left and each selected file marked with a check.

Backups are managed in a backup set, to which you assign a name and a set of backup rules. The set keeps track of a list of files it knows to be on tape. Scripts automate the process of selecting multiple volumes and applying access rules. For example, you may decide that on Monday you want to do full backups and that on Tuesday through Thursday you want to back up only the data files that have changed since their last backup. You can specify the backup rules by name, file type, date, and so on, to a dizzying level of detail. A scheduler allows you to have Retrospect Remote automati-

cally start at a given time and run a script.

Besides supporting a wide variety of QIC and 4- and 8-mm tape, the software will back up to any mountable drive, including Bernoulli and SyQuest cartridges. We tested Retrospect with an Archive Python DAT drive, an Irwin 5080 (120-MB) DC2000 tape drive, and a 90-MB Bernoulli drive. With file compression, Retrospect was able to cram about 150 MB of data onto each 90-MB cartridge. Our Mac IIfx is connected to the AppleShare network through standard 230,000-bps PhoneNet wiring, so the network was the gating issue in performance. Our test backups managed to send about 1 MB per minute to the Irwin 5080—not too shabby a showing for a mere LocalTalk network.

Multiplatform Picks

NetWare network administrators will appreciate TNA. Its fully automatic tape rotation and grooming support make backups a breeze. Even so, we'd suggest that you take an active part in the tape rotation by keeping copious notes. If something does go wrong, TNA may need some help in setting it right. If you would rather use a different rotation scheme, then consider ARCserve or LANStream. ARCserve treats your tape drives as a shared file server resource using a familiar NetWare interface, while LAN-

Stream uses a workstation on your network as a tape server.

Legato NetWorker and BudTool are perfect examples of the split that exists in the Unix user community. BudTool's appeal is in its ability to combine existing Unix commands, and even custom-developed routines written by the administrator, into a total backup strategy. NetWorker, on the other hand, is completely self-contained and not nearly as adaptable.

We can appreciate BudTool's approach, but we have to give NetWorker the nod here because, of the two packages, it is better suited to supporting the full range of user types. It's easy to use without being condescending, so novices can get the system going without feeling lost, and veterans can use the tools to save time without feeling like they're playing with a toy. NetWorker seemed to be the perfect network backup tool; there wasn't a thing we could imagine wanting to do that NetWorker didn't have available and easily accessible.

Mac network administrators should be more than happy with Retrospect Remote. It's as easy to use as any Mac software we have seen, and it makes the job of backing up remote workstations as easy as pie. ■

WE'VE LOWERED
THE COST
OF HIGH
PERFORMANCE
FOR FRAMEMAKER.

THE PERSONAL
DECSTATION
STARTS AT \$3995.

Today's applications like FrameMaker® demand the balanced performance of a complete workstation and only the Personal DECstation™ gives it to you at such an affordable price.

Many of the features other low-priced workstations offer, such as an open bus, 8-plane graphics and color, are add-ons. With the Personal DECstation, they're standard. And it's built for the future with new CPU and graphics cards, network interconnects and upgrades, multimedia technology and full Advanced

DIGITAL'S SPEED AND FLEXIBILITY ARE PERFECT FOR FRAMEMAKER.

FrameMaker and Digital combine to provide a complete document publishing system for creating business and technical documents. FrameMaker incorporates full-featured WYSIWYG word processing, graphics, page layout, tables, conditional text, equations editing, and structured document tools into a single, easy-to-use application.

FrameMaker supports the Motif windowing environment and takes advantage of the innovative tools available with Digital, such as Display PostScript. In addition, FrameMaker supports Digital's multimedia capabilities and allows you to seamlessly incorporate audio and video into your FrameMaker document. FrameMaker on the Digital platform is the complete solution for your document publishing needs.

For a trial version of FrameMaker, please call 1-800-U4-FRAME, extension 145.

Computing Environment (ACE) compatibility.

The Personal DECstation from Digital. The power of a workstation. The productivity of a workstation. The price of a PC.

DIGITAL. THE OPEN ADVANTAGE.

The Official Flag Of The

AMD Delivers The World's Fastest 386s.

The great 386 race is over. And the clear winner is the Am386 microprocessor family.

The fact is, no other 386 microprocessors available today can rival the sheer speed and performance of the Am386 microprocessors. The Am386DXL-40 CPU brings 40MHz,

full 32-bit 386 performance to the desktop. The Am386SXL-33 CPU makes 33MHz the standard for 386SX machines both at the desktop and for battery powered applications.

In either case, they're over 20% faster than those run-of-the-mill 386's.

The 40MHz DXL-40 and the 33MHz SXL-33 are available in low-cost PQFP packaging.

Am386 Microprocessors.

And of course, they're proven-compatible with the IBM® standard.

Best of all, they're available now, available in quantity, and available at surprisingly low prices.

So don't just keep up with the competition with ordinary 386 systems. Blow them away with the world's fastest 386 systems—built around the Am386 microprocessors from Advanced

Micro Devices. Call **1-800-222-9323** for more information.

"We're Not Your Competition."™

HARDWARE

Rough Gems: First Pen Systems Show Promise, Lack Refinement

NICHOLAS BARAN

The pen-input system is one of the most exciting recent developments in computer technology. The concept of an untethered, lightweight, notebook-size computer using a pen as the input device is compelling and opens up myriad new applications for computers. However, pen-based computers demand state-of-the-art components in almost every aspect of computer design: battery power and low-power electronics, display and digitizer technology, memory-card storage technology, ergonomics, handwriting recognition, wireless communications, and software development.

Pen-based technology is in its infancy. This review assesses some of the first pen-based computers on the market, including low-end machines using V20 and 286 microprocessors, as well as more powerful machines built on the 386SX. With the exception of the GridPad and MicroSlate Datellite, the machines reviewed here are among the first off the production lines. Several machines that made a big splash when announced (including NCR's 3125 and Samsung's PenMaster) weren't available, and much of the support software for these systems is still in development.

First Pass

Like the PCs of 10 years ago, these machines represent the first generation. In the next few years we'll see great improvements in many of their features and components, including display contrast and readability, battery life, weight, and form factors. Pen-based software will also make great strides in the next few years—faster and more accurate handwriting recognition, more "pen-centric" applications, better graphics and data-compression algorithms, and so forth.

But the application of these systems does not lie entirely in the future. The systems in this review are already finding utility in various mobile work environments, particularly those requiring the filling out of forms, such as inspection and appraisal work. And software development for pen-based systems is proceeding at a furious pace. Pen-based computers have arrived.

The First Pen Systems

I looked at five machines: the GridPad HD from Grid Systems, the TraveLite from DFM Systems, the Datellite 300 from MicroSlate, the Momenta Computer from Momenta, and the TriGem Pen386SX from TriGem. I evaluated them strictly on their merits as notepad computers in a mobile environment, although you can attach keyboards and use them as laptops or desktop machines.

All these machines weighed at least 4.5 pounds. Although that may sound light, it's pretty heavy in the crook of your arm. For comparison, *Webster's Ninth New Collegiate Dictionary* weighs slightly over 3 pounds. For pen systems to feel truly natural to the user, they will have to weigh no more than 3 pounds; I've tried the NCR 3125, and, at 3.3 pounds, it's barely acceptable.

Measuring battery life is difficult, since it depends on how the machine is used. Most of these machines have a low-power standby mode that shuts down the display and hard drive when the machine is idle. And, of course, many users will turn off the machine when they're not using it. Obviously, the actual battery life will vary greatly depending on how long the machine is powered on and the type of computing activity (e.g., activat-

ing the modem or performing lots of data transfers to disk will run down the battery faster than, say, scrolling through a RAM-resident reference document).

BYTE's standard battery-life test for notebooks relies on a script-driven hardware test rig that monitors the LCD screen and uses the keyboard to wake the machine when appropriate. Unfortunately, I wasn't able to use this test method for these machines without keyboards. Instead, I compared the machines' battery life by repeatedly running BYTE's system benchmarks until the batteries ran down. The BYTE benchmarks are compute- and hard disk-intensive and provide a worst-case scenario for testing battery life.

It was not easy to evaluate the software on the machines, since much of it is still in development or in beta testing. The NEC V20-based GridPad and the 286-based TraveLite run only DOS (Grid's PenRight environment runs on top of DOS). Thus, these machines won't be able to run Windows for Pen Computing, Go Corp.'s PenPoint, or Communication Intelligence Corp.'s (CIC) PenDOS, all of which require a 386 processor (a 286 machine can run Windows for Pen Computing, but poor performance makes this impractical). The Momenta Computer is a dual-boot machine that runs standard

Five of the first: These pen-input machines, ideal for mobile-computing applications, represent the first generation of pen-based systems. From left to right: the TriGem Pen386SX, the GridPad HD, the DFM Systems TraveLite, the MicroSlate Datellite 300, and the Momena Computer.

Windows 3.0 or the Momena Environment. The TriGem and MicroSlate machines came with a beta version of Windows for Pen Computing.

Grid Systems GridPad HD

The GridPad HD is the most established member of this group of pen-based systems. The first GridPad shipped in early 1990—the first pen-based computer on the market. Based on the Intel 8086 architecture, the GridPad is basically an MS-DOS machine customized to accept pen input. Grid Systems has announced a 386 version of the GridPad, but it is not shipping as of this writing. The GridPad software includes an on-screen keyboard so that you can execute DOS commands using the pen.

The key to the machine is the development of custom applications. Using a variety of software development tools provided by Grid and third-party software

developers, it's possible to develop custom applications for specific tasks. The machine has enjoyed some success in various vertical applications; for example, the city of San Francisco has been using GridPads for a post-earthquake building inspection program.

I evaluated the GridPad HD, a 10-MHz NEC V20 model with a 20-MB hard drive and a PCMCIA-compatible RAM card slot for backup and software installation. The model I tested weighs about 5 pounds (Grid claims 4.5) and has a 640- by 400-pixel, CGA-compatible, 10-inch backlit display. The machine is powered by an external power supply or by internal nickel-cadmium batteries.

The GridPad measures roughly 12 by 9 by 1½ inches and fits comfortably in the crook of your arm. It is well constructed, and the readable backlit display provides good contrast. The system includes configuration software that lets you turn off the backlight for outdoor use, extending battery life. The configuration software also provides options for controlling power management and other display attributes. The system comes with a well-written user's manual describing features and configuration options.

The pen is attached to the unit by its cord; it clips neatly on one side of the ma-

chine. The display is oriented horizontally with five programmable function buttons on the right side. The pen cord also connects on the right side, making left-handed use of the pen more inconvenient, since the cord drags across the screen.

When the machine boots, you are presented with a menu that lets you run the sample applications, switch to DOS, or perform diagnostics or configuration functions. You access all menu options simply by highlighting the option with the pen and then tapping on the Execute box. When you switch to DOS, an on-screen keyboard appears from which you can execute standard DOS commands using the pen as an input device, simply by tapping on the appropriate keys. I was impressed with the accuracy of the pen and the sensitivity of the digitizer.

The sample applications were a bit spotty. A sample expense report program sometimes refused to accept handwriting; the Grid Handwriting Tutorial didn't work at all. However, a legal briefing program with sample forms to fill

BYTE ACTION SUMMARY

■ WHAT PEN-INPUT SYSTEMS DO

These first-generation pen-input systems provide an intuitive, pen-based interface for mobile-computing applications.

■ LIKES

The pen interface is compelling, and these machines will provide excellent platforms for data-collection applications.

■ DISLIKES

There are technical hurdles that need to be overcome before these systems are truly practical. In particular, weight, display readability, and battery life must improve.

■ RECOMMENDATIONS

For forms-based data applications, the GridPad HD is a good choice. For more advanced applications that will require Windows for Pen Computing, PenDOS, or PenPoint, you may want to wait until more players enter the market; if you can't wait, the TriGem Pen386SX is worth a look.

BYTE NOTEBOOK BENCHMARK INDEXES

Low-level benchmark results for pen-input systems. The 20-MHz 386SX-based TriGem and Datellite systems did well, but there was relatively little variation. The Momenta Computer scored poorly, with low scores on memory-move tests. Toshiba's T2200SX is included as a baseline for comparison.

out worked very well. While frustrating, these problems are in the sample applications only and do not reflect an inherent problem with the machine or operating system.

Of the machines reviewed here, the GridPad is the only 8086 system. Naturally, its performance benchmarks are lower than those of the 286 and 386SX systems (see the figure). But for many custom applications, particularly simple forms, its performance is adequate.

Perhaps the GridPad's most impressive feature in comparison to the other machines is its battery life. The batteries held up for over 3 hours of continuous use. Along with MicroSlate's Datellite, the GridPad was a leader in battery life.

The system I reviewed sells for \$3570. That's a lot of money for an 8086-class system. It won't run Windows, PenPoint, or PenDOS. However, it is well built and has a proven track record. If you need to jump in right away and do some basic forms-oriented pen-based computing, the GridPad is a viable option.

**DFM Systems Travelite**

The Travelite is included in this review because it can be operated without a keyboard, but it is actually a touch-sensitive

system rather than a pen-based system. It comes with a plastic pointer shaped like a ballpoint pen for touching the screen, although you can also use your finger or the eraser of a pencil, for that matter. Like the GridPad, it has an on-screen keyboard for entering commands. The Travelite does not recognize handwriting, but you can draw on the screen with a drawing program.

Roughly the same size as the GridPad, the Travelite that I tested has an 80C286 CPU and a 20-MB hard drive. The system comes with a special cable that connects to the parallel port of another IBM PC compatible, giving the Travelite logical control of the drives on the connected machine. This is the method for transferring data or installing software on the Travelite.

The machine that I evaluated came with DR DOS 5.0 and a few sample applications. It included an optional detachable keyboard and a fax modem. DFM Systems has developed drivers for emulating the mouse in the touchscreen environment, presumably for use with Windows. However, Windows really favors a 386 processor.

The system also includes a condenser microphone for making short voice recordings and an optional voice board for delivering digitized speech.

The Travelite is designed, much like the GridPad, for custom applications, such as forms entry. The system comes with applications development software called the EasyTouch Application Generator, which is documented in a three-ring binder. Other than the EasyTouch binder and the DR DOS user's manual, the documentation is minimal (a 12-page

photocopied pamphlet is the extent of the user's manual).

The biggest disappointment with the Travelite is its battery life. My benchmark exercise exhausted the Travelite batteries in less than an hour. I tried the test several times, charging the nickel-cadmium batteries overnight after they had completely discharged, with the same result. The system has minimal power management and does not power down the hard drive when it is not in use, which could be part of the problem. In any case, DFM Systems needs to go back to the drawing board with its power management system.

This machine will appeal to applications developers working on turnkey mobile applications. The problem is that EasyTouch is a proprietary development environment, which will not attract software developers. And most nonprogrammers developing their own applications will find the system technically difficult to work with.

Without the keyboard and fax modem, the system I tested is priced at \$3466—again, pricey for a low-end system. The company needs to make some major improvements in the documentation and in power management. On the positive side, the machine could be a good choice for simple forms applications, much like the GridPad, provided that battery life improves.

**MicroSlate Datellite 300**

Like the Travelite, the Datellite 300 is a touchscreen computer. However, it is more capable than the Travelite, sporting a 20-MHz 386SX microprocessor and support for Windows for Pen Computing. The unit I evaluated included a 60-MB hard drive and 4 MB of RAM.

The heavy-duty Datellite, which the company dubs a "pen 'n touch notebook," is probably sturdy enough to survive a game of touch football. But there's a big penalty for the rugged design—namely, the Datellite's size and weight. The machine weighs almost 7 pounds with its two battery packs installed, and it measures about 13 by 10 inches wide and almost 3 inches thick. This would be

The Notepad 386SX

THE ULTIMATE BUSINESS TOOL

The Notepad 386SX is the first notebook computer in a notebook. It is a leather computer that is rigidly affixed to a custom leather notebook/portfolio and can be removed in seconds. The Notepad comes standard with a built-in send and receive Fax/Modem, 20 Mhz 386SX, 2Mb Ram, Page White VGA Display, Internal 3 1/2" Floppy and 40 MB Hard Drives all in a 1.5" thick computer.

The Notepad 386SX combines leading edge technology with genuine leather for an aesthetically appealing and elegantly functional business tool. The Notepad 386SX's open face style, coupled with its sleek design, represents a uniquely different alternative to almost all other notebook computers available today.

a tough machine to carry in the crook of your arm for any length of time. The machine has a handle so that you can carry it like a briefcase. Nevertheless, the size and weight of the machine make it a questionable notebook.

On the plus side, the Datellite is one of the better-constructed machines I looked at. It has a solid battery life of over 3 hours, and it offers good performance. The VGA-compatible backlit LCD is easy to read and has excellent contrast and brightness. Since it's a touchscreen, you can use any pointing device with it, but MicroSlate provides a package of plastic pens. The machine has an on-screen keyboard for entering DOS commands, and it boots up with a custom menu, giving you the option of executing sample applications or running Windows.

Like the Travelite and GridPad, the Datellite is intended for custom data-recording applications. The machine comes with a comprehensive set of development tools. Chief among these is the extensively documented DataSlate applications generator.

The Datellite came with a beta release of Windows for Pen Computing. The touchscreen interface worked remarkably well with Pen Windows. I tried the various included handwriting applications as well as other sample programs, such as Slate's PenBook, which all ran without a hitch.

The big problem with the touchscreen interface is the lack of a second button. Most electronic pen systems include a side button on the pen, which acts like the second mouse button on the Micro-

soft Mouse. Many applications require this second button, as does CIC's PenDOS interface. There are ways around this limitation, of course, but if software developers must provide modified applications for systems without a second button, Datellite software may be difficult to come by.

The Datellite 300 is a well-built and full-featured computer. It even has a SCSI connector for attaching a CD-ROM drive, and it can include a 3½-inch floppy drive. But its size and weight put it more in the class of portables than notebooks. If you have to put the machine down on a workbench to really work with it, then the pen doesn't buy you as much as it could.

Momenta Computer

The "pentop" Momenta Computer is interesting and innovative, designed for both desktop and mobile use. With the keyboard attached, you can tilt the display and use the computer as a desktop, or you can operate it with a pen without the keyboard. However, the Momenta weighs in at over 6 pounds, making it heavy for extended hand-held use. The machine measures 10 by 12 inches and is

wedge shaped, making it a bit bulky for the crook of the arm.

The Momenta Computer is powered by internal rechargeable nickel-cadmium batteries or by an external power supply. The company plans to support standard AA alkaline batteries in the near future and will supply the necessary upgrade to current owners. The pen is tethered by its cord, which plugs into either the left or right side of the computer—a thoughtful design feature for lefties.

The most interesting aspect of the Momenta Computer is its software. It's a dual-boot machine, booting up either with Microsoft Windows or with the Momenta Environment, which is a graphical pen-interface layer on top of MS-DOS. Windows and the Momenta Environment are mutually exclusive.

Microsoft Windows acts as expected. The pen behaves like a mouse: You can double-tap to open applications, drag the mouse cursor with the pen, pull down menus with the pen, and so forth.

The Momenta Environment is a proprietary GUI designed for pen input and control. It has unique features, such as a command compass, which is a pie menu with options for edit, cut, paste, copy, and delete. The menu appears as a background function behind appropriate icons or fields on the screen. For example, when you're writing characters in a field, you can press the side button on the pen to bring up the command compass, and then perform editing operations on what you've written.

The Momenta Environment is an ambitious software system built on Smalltalk. Its bundled applications include a

Up to Date. Down to Earth.

UNIX is changing the world of computers, the world of business – quite simply, changing the world. It's revolutionizing office automation. It's required for U.S. government computer contracts. It's the backbone of information strategies worldwide.

That's why you need **UNIXWORLD** – the magazine that keeps you up to date on the rapidly changing world of open systems computing. Each issue brings you the latest product trends and technical advances that can affect your business. The inside story on some of the biggest high-tech companies. Easy-to-understand programming tips and tutorials that can help your company use UNIX to its fullest. And unbiased hardware

and software reviews to help you invest wisely when you buy.

UNIXWORLD's in-depth features go beyond dry technical facts to show how the pieces fit together – to tell you what's important about the advances and strategies that are changing your world. And **UNIXWORLD** consistently offers the freshest, most down-to-earth writing that you'll find in any computer publication.

Subscribe today and receive the next 12 issues of **UNIXWORLD** for just \$18.00 – half the regular newsstand price. Save even more by ordering for two or three years. You can't lose – every subscription to **UNIXWORLD** comes with a no-risk guarantee*.

DH1AUW9

handwriting trainer, a fax program, an address book and calendar, an on-line tutorial, a spreadsheet program, a presentation graphics program, and a text editor/word processor (this application was not ready at the time of this review and is to be included in a free update to all current Momenta owners).

Conceptually, the Momenta Environment is very elegant. You move from one application to another simply by opening the next application with the pen. This feels a bit like multitasking, although task switching is really what's going on. The fax application worked very well. In theory, the environment supports hand printing in all applications.

But although elegant in concept, the Momenta Environment is not quite ready for prime time. The handwriting recognition is inaccurate, much worse than other handwriting recognition systems I've seen. Even after going through the handwriting trainer program, which requires you to print about 12 screenfuls of characters, the system still interpreted my first name NICK as UL36. Users will not tolerate this level of inaccuracy.

Handwriting recognition problems are

likely related to the imprecision of the pen. The system provides a calibration program, a tedious procedure in which you tap the pen on a bull's-eye that moves around on the screen, the objective being to ensure that the pen is pointing accurately at objects on the screen. However, the pen is constantly slipping out of calibration. I had to tap about an eighth of an inch to the left of a window's close box to get the window to close.

These problems are only the tip of the iceberg. The reflective display provides poor contrast and brightness, making the screen difficult to read except in very bright light. The compass menu, which is designed to appear in the background, is barely visible. To make a long story short, it takes a lot of effort both with your eyes and with the pen to use this machine. And that is contrary to the intent of pen-based computing.

But perhaps the most surprising problem with this machine is its battery life. Momenta claims to have developed some innovative power management techniques for this machine. But when running all out on the BYTE benchmarks, the batteries lasted no longer than half an

hour. Each of the two battery packs delivered with the system gave dismal battery-life results.

The Momenta Computer's test results are poor when compared to those of the other 386SX systems. This is probably due to poor performance on memory-move benchmarks. The machine feels even slower when running the sluggish Momenta Environment. When running Windows, the performance is about average for a 20-MHz 386SX-based system.

Momenta plans to address these concerns with a series of software updates; the company plans three updates by July. According to Momenta, these software changes will greatly improve performance in three areas: speed, battery life, and handwriting recognition. System software updates, when available, can be downloaded directly to customers' systems from Momenta's BBS.

The Momenta Computer is a bold and innovative project. But it has been delivered to market too soon. Momenta will need to address a lot of problems with its aggressive software upgrade plans before the system will be competitive, particularly at a price of close to \$5000.

GREAT THINGS COME IN SMALL PACKAGES

This powerful print server can tackle your biggest network printing problems

- Connects any parallel printer directly to your Ethernet LAN
- Fully Novell Netware 286 and 386 compatible
- Can attach to 8 file servers simultaneously
- Fast and easy to install
- Combines high-speed printing and exceptional printer control
- Supports encrypted passwords, forms, notify, cancel, and others
- Full one-year warranty and unlimited free technical support
- Made in the U.S.A.

ALDUS PHOTOStYLER FOR WINDOWS.

FOR PEOPLE WHOSE IMAGINATIONS EXCEED REALITY.

With Aldus® PhotoStyler™ you can create anything you have a mind to.

PhotoStyler is the complete color photo lab for Windows. It allows you to process scanned images in 24-bit full color or gray-scale, then separate them. And you can do it on your PC.

Featuring color correction, retouching, filtering, composition, painting, and special effects, PhotoStyler also lets you work with several open images at the same time. (The built-in JPEG compression enables you to conveniently store and access files.) And you can export your work to other DTP, multi-

media, and presentation applications — such as Aldus PageMaker® and Aldus Persuasion®.

No wonder PhotoStyler's innovative graphic capabilities have been drawing rave reviews. *Publish* magazine's Reader's Choice Awards named it the "best image editing software for the IBM PC." While *InfoWorld* rated its image editing tools "Very Good" — and found PhotoStyler easier to use than its two leading competitors.

To learn more, call 1-800-685-3580 for a free trial version. And discover the high-end PC color photo lab that's nothing short of unreal.

TriGem Pen386SX

The Pen386SX was designed by a firm in Rainow, England, called the Eden Group, and manufactured by TriGem of Korea. Several other hardware vendors have licensed it, so it may appear on the market under a variety of monikers. The Pen386SX represents what I think will be the typical first-generation 386SX pen-based computer. It's a flat tablet about 1 inch thick and about 10 by 12 inches on a side. It is surprisingly heavy, weighing in at 4.9 pounds.

The machine I tested has a 20-MHz 386SX processor, 4 MB of RAM, 4 MB of flash memory, two PCMCIA memory card slots, and a backlit 640- by 480-pixel VGA display. The flash EPROM consists of 512 KB of boot memory, dedicated to the boot sector and operating system, and another 512 KB (up to 1.5 MB) devoted to the Microsoft flash file system.

The pen operates through a cable attached under the computer. One feature that seems a bit shortsighted is that the serial port is built into the external power supply and connects to the computer via the power cable. Obviously, you can't use the serial port without the power supply—not an ideal solution for mobile users running the computer on the rechargeable nickel-cadmium batteries.

The unit I evaluated was one of the first off the production line. I found the contrast a bit weak for a backlit LCD, and the pen was poorly constructed. On the plus side, the machine had excellent proximity sensing—almost too sensitive, in fact. Bringing the pen near a Windows icon or dialog box highlights the box. A gentle tap activates it. The pen operated smoothly and required little pressure.

One interesting feature is a user-programmable border area about 1 inch wide that surrounds the active screen. Programmers can set up icons and functions that can be accessed in this area.

My battery-life exercises yielded a battery life of about 2 hours. I found this a bit disappointing considering that the machine does not have a hard drive. The benchmark performance was consistent with that of other 386SX machines.

Ultimate Pens

If you urgently need forms-based data retrieval in a mobile environment and can get by with MS-DOS, the GridPad may be a good choice. However, the pen-based market is shifting toward Windows for Pen Computing, CIC's PenDOS, and Go's PenPoint. For these environments, you'll need a 386-based system, preferably with an electronic pen.

I'd recommend waiting until this summer when more machines will be available and at more competitive prices. But for now, TriGem's Pen386SX is the best bet among the systems in this review. With a few improvements, it will be a solid contender in this nascent market. ■

Nicholas Baran is a BYTE consulting editor and coeditor of Pen-Based Computing, an industry newsletter based in Sandpoint, Idaho. You can contact him on BIX as "nickbaran."

Professional Software and Hardware-Assisted Debuggers for 80386 & 80486 Systems

If you need a debugger but have no room left in the lower 640K of your 386™ or 486™ system, Periscope now has a new SOFTWARE-ONLY solution for you—Periscope/EM.

- Periscope/EM takes advantage of the extended memory you already have, rather than using any memory in the lower 640K.
- No runaway program can corrupt Periscope/EM because it's write-protected.
- You don't have to use a slot since there's no board to install.
- You can add an optional break-out switch to recover from crashes.
- Periscope/EM costs only \$295, half the cost of Periscope Model I, with most of the same functionality.

Periscope/EM requires 386MAX® or BlueMAX™, version 5.11 or later; a 386 or 486 system with about 300K of extended memory; 32K of memory between 640K and one megabyte; DOS 3.0 or later.

Booth #812

SOFTWARE DEVELOPMENT '92

New Debugging Tools

"I needed a means to debug interrupt handlers where I could really see what was going on. The hardware trace buffer is great. I was able to debug code in 3 days that I have been trying to debug for months!"

...writes Peg Sestrich with Prime Computer, on why she chose Periscope Model IV.

If you need more than your current software-based debugger gives you, Periscope Model IV, with these advanced NEW features, may be just what you're looking for:

- Supports 386 and 486 systems running up to 33MHz with its ICE-like capabilities.
- Real-time hardware trace buffer holds up to 16K CPU events.
- Enhanced analysis and display of trace buffer makes you more productive.
- Periscope/EM functionality, built-in at no extra cost, saves you money.

Just call toll-free 800/722-7006 for details or to order.

Big Screen for Windows

COMDEX®
BOOTH #652E

No question... this 17-inch monitor from ViewSonic is the ideal "big screen" choice for Windows. In fact, in a recent InfoWorld product comparison, the ViewSonic 7 was rated #1. Our monitor was designed for people who know what they want and won't accept second best.

The competition claims we're unfair. That's because the up-graded ViewSonic 7, with resolution up to 1280 x 1024, features microprocessor-based memory along with 26 programmable preset modes. And it has a flat square, anti-static screen to eliminate

distortion and provide a sharp to-the-edge picture. Plus, for a flicker-free image, it boasts of ultra-high 76Hz refresh rate. This monitor even meets low-radiation strict Swedish MPR-2 standards!

ViewSonic 7—the ideal 17" big screen monitor for the full-scale Windows environment.

ViewSonic®

What is Temptra?

The Only Complete, Affordable Multimedia Solution!

TEMPRA™

Now is the perfect opportunity to jump on the multimedia bandwagon. Mathematica's family of TEMPRA products forms the fastest and easiest, yet most advanced and affordable, color imaging and multimedia tools for DOS- and Windows-based PC computers. TEMPRA's revolutionary graphic user interface makes the products incredibly easy to learn and use.

Scan, edit, create, capture, paint and print images in **TEMPRA PRO** and **TEMPRA GIF** — up to 16.7 million vibrant colors! Then import your images and video into **TEMPRA SHOW** to produce dynamic presentations with audio, animation, and sophisticated wipes.

Our TEMPRA products provide the functionality, performance, and sophisticated paint tools found in other products costing more than \$2000. Plus, you'll find unparalleled speed with our **TEMPRA turbo charger** add-on feature, which brings 32-bit power to graphics and imaging — use your 386/486 to the fullest now!

TEMPRA's powerful integrated features include:

- ♦ Intuitive GUI with a variety of adjustable paint tools including airbrush, pens, geometry shapes, text, mask transformation, filters, color swap, and color protection
- ♦ Support of ComputerEyes/RT™ — real-time, 24-bit video frame grabber for capturing high-quality images from any video source in 1/30th of a second.
- ♦ Photorealistic scanning and printing, including special tools for the best quality image.
- ♦ Support of Animator™, Animator Pro™, and 3D Studio™ flick (.FLI and .FLC) files.
- ♦ Audio support from CD-ROM, MIDI, or recorded onto the hard drive with a Sound Blaster™ card.
- ♦ Fast enough to run on even a 286 system. And on a 486 fasten your seat belts!

"Mathematica's Tempra 24-bit paint program was another winner, providing unparalleled editing speed."

Adam Osborn
NewMedia,

November/December 1991

"A top-flight painting/photo retouching program with amazing capabilities. Video speed, even for 24-bit color files, is remarkable. Highly recommended."

Susan Glinert-Stevens
PC Sources, November 1991

"Tempra Pro has some very powerful features. The package's color manipulation and control are hard to beat. Overall, Tempra Pro is an excellent graphics editor that's very easy to use and quite powerful. You will find it possible to create and edit images whether you are a beginner or a professional."

Marc Greenfield
Computer Buying World,
November 1991

"Tempra really stands out when working with true-color images. The output from Tempra is excellent. Overall Tempra is a good program. Those who work with full-color images — and any of the supported color scanners — may find it a valuable tool. And the ability to work with video input offers interesting possibilities."

Leonard Hyre
PCM, November 1991

"Tempra gets our nod for PC-based programs. It's the least expensive of the lot and handles a variety of image formats."

Tom Thompson
BYTE Magazine, June 1991

ART

For Business's Sake

Designing eye-catching visuals isn't just for artists anymore. One of these packages is sure to make it easier for you to create good-looking pictures, charts, and graphs.

**D. BARKER,
RAYMOND GA CÔTÉ,
DAVID L. EDWARDS,
TOM THOMPSON, AND
STAN WSZOLA**

Gone are the days when you could pass out an unembellished pie chart done up on a dot-matrix printer and expect praise for your efforts.

Once confined to the art department, graphics packages are making their way to desks further afield. Many a spreadsheet ace has developed a fondness for graphing programs, engineers in the lab frequently depend on drawing programs to illustrate new designs, and even CEOs have been known to crank up their favorite charting programs to make sense of the next quarter's projections.

Heightened interest in marrying information and compelling images isn't the only explanation for the growing importance of business graphics software, however. Personal computers that have the horsepower to

In this highly visual age, looks are nearly everything. And the business of doing business is more closely linked than ever to putting the best-looking graphics forward. Whether trying to communicate ideas, disseminate information, or enhance their corporate image, enterprises today increasingly rely on sophisticated computer graphics software. Drawing, painting, and charting packages are pressed into service for everything from designing logos, developing product designs, and rendering illustrations for manuals or catalogs to making presentations and sprucing up a report or proposal.

crank out good graphics are no longer too exotic or too expensive. As a result, an increasing number of IBM compatibles are—like their Macintosh brethren—equipped to handle gloriously realistic color. Likewise, color printers and plotters have come down in price.

Finally, as we found when testing the products for this report, the software itself has gotten more powerful and less intimidating. While it takes practice to master Bézier curves—the design department needn't worry about accountants taking over those job responsibilities—you probably can find a package that overcomes many of your artistic limitations.

There is, as of yet, no digital substitute for aesthetic sense, but computer graphics programs are here to stay and here to play a critical role in business communications. But how do you even start to choose from the smorgasbord of business graphics software on the market today? Our approach was to search the field. In the process, we turned up nearly 100 programs for PCs and Macs—programs that handle the basic needs of business: drawing, painting, charting, and graphing. (Although slide-show presentations are a big part of business graphics today, we feel presentation software deserves separate coverage.) To maintain our

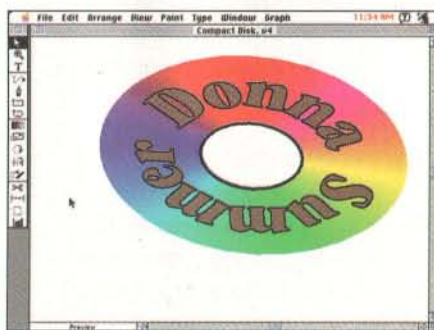

business-type images. The program supports only 16 colors, but then it needs only 400 KB of memory to run.

Because it was developed as a companion to WordPerfect, AccuDraw has some rather unusual graphics file-handling methods that revolve around the WPG format. The bit-mapped graphics from paint programs, clip art libraries, and scanned images can be edited on-screen, or you can convert them to the WPG format with WordPerfect's conversion utility. Any file formats not supported by the program's GRAPHCV utility can be captured using the GRAB screen-capture program also supplied with WordPerfect.

To edit bit-mapped images, you must use the package's built-in pixel editor. For other editing functions (e.g., moving, scaling, and rotating) a bit-mapped image is treated as a vector object, and pixel data can't be changed. AccuDraw renders pixels into *vector space* using a floating-point calculation for each pixel. Vector objects may be drawn on top of bit maps.

AccuDraw's latest release, 2.11, includes PostScript laser printer drivers, an extrusion function that lets you push an object into the shape of another object, and a feature that lets you draw a curve and then lay text down on it. For the millions of WordPerfect users, AccuDraw has ample tools, is simple to use, and is versatile enough to create respectable artwork.

—D. E.

ADOBE ILLUSTRATOR 3.0.1

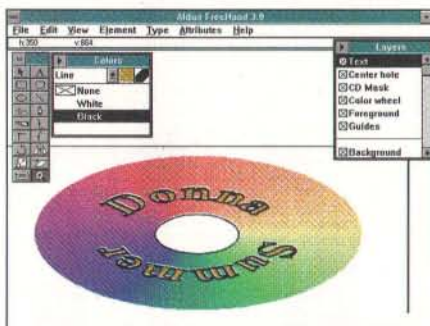

Still one of the best object-based drawing packages for the Mac, Adobe Illustrator 3.0.1 has an excellent set of drawing tools for freehand curves, text, and objects (circles, rectangles, and so on). Its interface allows you to draw, modify, and color objects with a minimum of fuss and great precision. On top of that, Illustrator provides ample text-handling capabilities. You can type text into a

window, set the color of the text's outlines and fill patterns, and then wrap the text around an object—a circle, perhaps—or get it to conform to a freehand curve. The package's Compound Objects feature lets objects in the background show through openings in foreground objects or in text.

Illustrator's method of coloring objects is disconcerting at times. It leaves messy black blobs composed of intermediate curves on the objects being colored. Fortunately, these blobs don't show up in the preview screen or on the printout. The package won't let you edit images in preview mode and also needs some sort of layering control to help organize and manage complex images.

The beta version of Adobe Illustrator 4.0 for Windows, which I recently got a glimpse of, promises to be as capable as its Mac counterpart and, thankfully, eliminates the preview editing flaw.

—T. T.

ALDUS FREEHAND 3.0

Aldus FreeHand 3.0, another object-based drawing package, is available in both Mac and Windows versions. FreeHand's strengths lie in its ability to organize your artwork's objects into layers and in its superb color-blending facility. Placing a blended color in an object is a simple matter of selecting the object and picking two colors and the fill direction. Furthermore, no black blobs appear after an object is filled, which makes it a snap to edit artwork.

A Layers palette enables you to design and manage very complex artwork. With it, you can create and name a layer, then selectively hide or reveal the objects that belong in that layer. This capability would prove useful if, for example, you were working on an aerospace drawing that required separate layers for the plane's fuselage and landing gear layer. Better still, you can edit the preview image.

Like Adobe Illustrator, Aldus FreeHand lets you wrap text around objects and curves and construct compound objects, which permits you to create special effects with text. FreeHand's big weakness is its interface: You sometimes must trek laboriously through menus and dialog boxes to set up the colors or color blends, and you must go through a dialog box to enter text into the artwork.

—T. T.

ARTS & LETTERS APPRENTICE 1.0

Arts & Letters Apprentice 1.0 is an object-based drawing program for Windows. The package includes over 3000 clip art images, 24 typefaces, tools for manipulating objects and creating charts, and a powerful mixing feature that can blend over 16 million colors.

The program's file-handling capabilities are average: You can export just seven graphic file formats and import five formats, including TIFF and PIC. GED, the program's native file format, is not a common one.

Another drawback is that, if you are working on a fairly large image, screen redraws are frequent and time-consuming on a 386 machine. Even when you close a dialog box, the graphics in your work space are refreshed, slowing any additional drawing and editing tasks.

If you need a virtually unlimited number of personally mixed colors, then Apprentice will serve you well. It offers three color-modeling methods: RGB, CMYK (cyan, magenta, yellow, black), and one based on hues. You combine colors by sliding a bar that controls the proportion of the mix; Apprentice immediately displays the resulting color on screen. Another very clever color mixing utility is Graduated Fill, which you can use to gradually change the color of an object—making it dark blue at the bottom and light blue at the top, for instance.

continued

We understand how you feel when your presentation goes badly.

If your LCD projection panel doesn't perform as well as you do, you're the one that ends up looking foolish. That's why we gave the MagnaByte® 6001 true color saturation and outstanding image clarity. And we made it so easy to set up and use, virtually anyone can give a professional, glitch-free presentation. Anywhere.

With the lightweight MagnaByte 6001, whatever appears on the computer screen is projected in thousands of crisp, rich colors

through an overhead projector. And you can still use your mouse or key commands to manipulate graphics, call up different screens or type in new text. All in brilliant 640 x 480 resolution.

Seeing is believing. Ask your AV dealer for a comparative demonstration. For the Telex dealer nearest you, call 1-800-828-6107.

Because if you can't show it as well as you know it, your presentation isn't the only thing that will suffer.

©1991 Telex Communications, Inc.

The MagnaByte® 6001.

Compatibility: IBM and IBM-compatibles with VGA output; Macintosh II and LC.

TELEX®

Arts & Letters Apprentice is a capable desktop graphics package and is a good choice if you are looking for a wide variety of prepackaged, high-quality clip art objects and symbols, powerful color mixing capabilities, and a charting tool.

—D. E.

CANVAS 3.0

Part drawing program, part painting program, Canvas has enough features to cover nearly any situation. The object-based tools in this \$399 package are well suited to creating technical designs, such as architectural documents and engineering drawings that make heavy use of lines. Grids, alignment functions, Smart Mouse, and the Object Specifications dialog box (a CAD-like feature that positions an object according to user-defined constraints) help you place and modify a drawn object with precision. Canvas's Bézier curve-drawing tools are as good as any in the more expensive, PostScript-based programs.

But you also can paint away in free-form fashion. Tools for painting and editing bit-mapped images include the usual brushes, pattern buckets, spray can, and pencil (for freehand work). Canvas, which supports 32-bit color, treats whatever you paint as an object. After selecting an item you've painted, you can apply effects to it, move it around, and change its size.

Beginning with version 3.0, Canvas incorporates a number of impressive features for working with text. Not only can it fill a shape with text, wrap text around a shape, or superimpose text on a curve, the program can convert Adobe Type 1 and TrueType fonts into editable Bézier curves. Because Canvas 3.0 treats each text character as an object, you can modify text characters in just about any way you want—by scaling, slanting, stretching, and even coloring them.

Other highlights include support for System 7 and its Publish and Subscribe

feature, the ability to produce color separations and slide-show presentations, and a comprehensive kit of special effects.

A program with 48 tools and dozens of customizable functions runs the risk of being overwhelming. Luckily, Canvas's developers have given users enough control that they can avoid too-many-things-on-the-screen syndrome.

With its extensive toolbox and wonderful flexibility, Canvas 3.0 is more than adequate for producing technical drawings, artistic illustrations, and textual graphics. Like the great DaVinci, this program is at home in the spheres of art, science, and business. If I could buy only one Mac graphics package, Canvas 3.0 would be the one.

—D. B.

CORELDRAW 2.01L

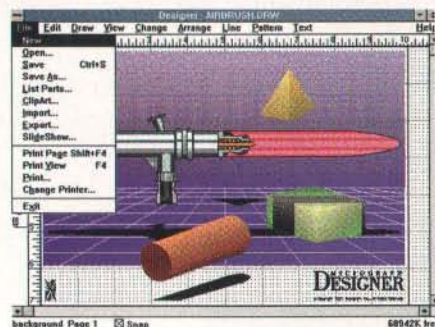

Windows-based CorelDraw is a capable object-oriented drawing package endowed with both extensive drawing tools and good text-handling capabilities. Its Extrude feature, for instance, lets you reshape an object—allowing you to push a circle into a cylinder, for example, or blow up text to fill a balloon shape. CorelDraw also lets you superimpose one object on another and drop color blends into an object.

The package's excellent Align feature lets you line up objects by their sides or by their centers, which is handy for organizing complicated, overlapping objects. You can examine your results in a full-screen preview mode, or in a unique split-screen mode that presents the editing window along with the corresponding preview image.

But CorelDraw does have its faults. Like Adobe Illustrator, CorelDraw's blending feature leaves a huge mass of curves that get in the way whenever you try to modify artwork. And it lacks layering control and the ability to temporarily conceal objects. As a result, creating complex art-

work can prove a daunting task. Finally, CorelDraw is slow. Running it on anything other than a fast 386- or 486-based computer with lots of RAM and a high-speed hard disk is torture.

—T. T.

DESIGNER 3.1

Micrografx's competitor to CorelDraw, Designer 3.1, comes with a flexible set of drawing tools that makes the package a strong contender as a technical illustration package. The \$695 Designer has numerous drawing tools for creating pie shapes, rectangles, lines, Bézier curves, arcs, and parabolas, as well as special tools for skewing objects, rotating text, or making text or other elements conform to curves. This abundance of tools makes Designer powerful, hard to learn, and sizable. Installing the complete program requires 10 MB of hard disk space.

Designer is customizable, however. You can change or simplify the screen display, adding or removing tools in the toolbox. You can also customize the program's menuing system by adding fill patterns, colors, and other attributes to dialog boxes. In addition, Designer lets you create and edit drawings with as many as 64 layers, and edit drawings in either full-color or wire-frame modes.

To insert or edit text included in an illustration, you don't need a separate editing window. Designer permits you to apply typographic controls to individual characters or to blocks of text, and you can easily superimpose editable text on curves. You cannot, however, apply gradient fills to text objects without first converting them to curves. To vary the appearance of your text, you can use Bitstream- and URW-compatible fonts—or choose from among the 41 typefaces supplied with the program.

Designer doesn't skimp on color. It offers support for 256- and 24-bit color files and can accommodate video cards and monitors with resolutions as high as

Not only is the Phaser™ II PXi the first thermal wax printer with Adobe's PostScript™ Language Level 2 software, it also has HP-GL. What more could you want from a printer?

Now make your ideas even brighter.

You say you want brilliant color fidelity? Rest assured the Phaser II PXi is approved by Pantone and features TekColor™ color matching.

A screaming 24 MHz RISC processor and 6 Mb of memory make the Phaser II PXi the fastest color printer on the market. Really.

So you have this great idea. One that'll win an account. Break a sales record. Or simply make you look like a genius. Don't blow it with a color printer that won't do your brainwork justice.

Get the new Phaser II PXi, a thermal wax printer that works simultaneously with Macs, PCs and workstations. It can generate 16.7 million colors at 300 dpi, and it's cost-effective.

To see the quality of its output first hand, call 1-800-835-6100, Dept. 16J and we'll send you a free sample.

The new Phaser II PXi. It'll make your ideas look as bright as they should.

LARGER DISPLAY AREA FOR
BIGGER IMAGES

BRIGHTER SCREENS FOR
SHARP, CRISP IMAGES

NON-INTERLACED, FLICKER-FREE
DISPLAY FOR LESS EYE STRAIN

WISHES DO COME TRUE. And at MAG Innovision™ our new MX-Series color monitors are making a number of wishes come true. These advanced displays are great for all types of applications, particularly Microsoft® Windows.

4 MODELS TO CHOOSE FROM. With a variety of sizes and tubes to select from, there's an MX display just right for you. The MX15F and MX17F make use of the latest flat square tube technology to offer distortion-free images, while the MX14S and MX17S utilize proven Trinitron® tubes.

LARGER DISPLAY AREA. Every MX-Series monitor uses advanced overscan technology to provide an edge-to-edge active display area that dwarfs displays of comparable size by as much as 36 percent!

WISHES
GRANTED.

HIGH-RESOLUTION. MX monitors offer the highest resolution you can find in any display of comparable size. In fact, at 1280 x 1024 non-interlaced, the MX15F displays four  times the information available with standard VGA. That means more windows on the screen...more information...more productivity!

BUILT-IN MICROPROCESSOR. Each MX-Series display has its own microprocessor that can adjust the display format automatically to work with almost any of the available video standards. So whether you're

BUILT-IN MICROPROCESSOR FOR
AUTOMATIC CONFIGURATION

A WINDOWS® WISH LIST.
INTRODUCING THE ULTIMATE
WINDOWS DISPLAYS.

HIGH-RESOLUTION FOR MORE
WORK SPACE

changing a video mode or upgrading a video card, the MX display will adjust automatically. And, if you do make adjustments, you only do it once. An MX display never forgets.

SHARPER, BRIGHTER IMAGES. By incorporating an Invar Shadow Mask into the MX15F and MX17F, we've achieved 30 percent more brightness without sacrificing sharp, crisp focus. And when combined with our high-resolution and fast-refresh rate, that 30 percent more brightness truly creates an image to wish for.

LISTEN TO THE EXPERTS. Don't just take our word for it. We're partial. Read *PC Magazine's* "Editors' Choice" for July 1991. They said of the MX15F... "clearly the best." Or listen to *PC World* (12/91) rave about the MX17F... "so great that it defies comparison."

WISHES DO COME TRUE. The next time you go window shopping to look at Windows displays check out an MX monitor. For more information on how to make your wishes come true, call us now at 1-800/827-3998, or contact us at our corporate headquarters: 4392 Corporate Center Drive, Los Alamitos, CA 90720. Tel: 714/827-3998. Fax: 714/827 5522.

A Comparison of Capabilities

Painting and drawing features: All of the graphics packages we looked at had basic tools for image manipulation. Advanced or user customizable tools, such as customizable patterns or modifiable brushes, can give you more professional-looking results. Charting and graphing features: The larger the number of data points and data sets a package can handle, the greater the detail a chart or graph can display. (● = yes; ○ = no; N/A = not applicable.)

Super VGA resolution. Micrografx Designer is well suited to handling complex technical drawing and sophisticated images. With its multitude of special-purpose tools, Designer is difficult to learn, but it is a powerful illustration package.

—S. W.

HARVARD DRAW FOR WINDOWS 1.0

Software Publishing's Harvard Draw for Windows is an object-oriented program that gives you a snappy drawing interface with 18 speedy drawing tools. Its support for as many as 99 layers within each illustration (think of each layer as a separate sheet of acetate) makes this a drawing and painting package for the professional artist.

You can work in multiple windows, creating, previewing, and editing full-color images. The package offers 16.7 million user-defined colors with 12 pre-designed palettes of 150 colors each, as well as user-defined palettes. Equally important, you can undo up to 16 actions in a row, blend objects, make multiple copies of an object, and cut holes in objects. The program can import and export a wide range of vector and bit-mapped file types. You can call up clip art files and symbols into separate windows, using a thumbnail image to preview them before you go further.

Harvard Draw for Windows takes much of the guesswork out of moving objects. As you move your mouse, a black-and-white outline of the object shows its exact position on-screen. The original color object remains in place until you release the mouse button. Unfortunately, though, every time you move or modify an object, the screen must repaint itself. This is slow on a 386 machine, even for simple images. Be prepared to spend at least an hour loading the 12 program disks onto your hard drive.

—D. E.

MASS-11 DRAW 6.1

Looking at the screen display of Mass-11 Draw 6.1, you might think it was a low-end PC/XT version of a drawing package, but don't let this less-than-pretty picture deceive you. DOS-based Mass-11 Draw actually has enough sophisticated features to interest users who want to create engineering and technical illustrations without investing in a more expensive CAD application.

Mass-11 Draw provides a spline curve tool with several interactive drawing

methods, as well as a utility called Tracer for converting scanned TIFF images, paint program images, or bit-mapped images into a drawing file that you then can edit and scale. Drawbridge, an on-board TSR graphic file-translation utility, can handle HPGL, PICT, MDL, and PIC files. Mass-11 Draw lets you use a digitizing tablet to trace artwork for input into the program and reportedly will display the tracing to an accuracy of 0.002 inch. The package includes libraries of clip art and symbols.

A few of the program's features are somewhat unwieldy, however. When you cut and paste objects, they end up positioned in the center of the screen—whether or not that's where you want them. And rotating an object to any angle other than 90 degrees or 180 degrees skews the object.

If you need a good library of prepackaged technical clip art and symbols, and a powerful tool for drawing spline curves as well as other basic drawing tools, then Mass-11 Draw will get the job done.

—D. E.

MACDRAW PRO 1.0

In the process of acquiring Pro status, object-based MacDraw Pro has become proficient at handling color, curves, and text. It has the curve-wrangling functions found in PostScript packages such as Aldus FreeHand and Adobe Illustrator. The Bezigon tool—as in *Bézier* and *polygon*—lets you map out a curve by placing points on the page with mouse clicks rather than by pulling on handles as you would with Adobe Illustrator or Aldus FreeHand. If you're one of the humble mortals frustrated by the usual Bézier methodology, you might find this connect-the-dot procedure more to your liking. And if you want to go back and edit a shape, you just pull on a dot or control point, dragging the line where you want the curve to pass.

Not only does it support 24-bit color, MacDraw Pro has good color-mixing capabilities and lets you set up custom, tear-off color palettes. For shading objects, the package provides a palette of 16 preset gradients (directional, circular, or shape burst) or you may easily develop new ones with the program's nicely implemented editor.

The package has the usual pens and tools for generating geometric shapes (e.g., rectangles, ovals, and arcs), as well as a freehand drawing tool. You create text just as you would an object. That means you can apply colors and fill patterns to characters, but you cannot automatically fit text inside a shape or make it conform to a curve. Oddly, System 7 functions are scarce: TrueType support, virtual memory, and the use of aliases.

MacDraw Pro will never get pulled over by the Highway Patrol; gradient fills are especially time-consuming. Even on a Mac II hopped up with a Radius Rocket, a circular fill took 15 to 20 seconds. While color manipulations can tax any system, this program is noticeably slow. Claris itself has acknowledged as much, promising speed

Rasters and Vectors

Computer graphics has evolved into a jungle of file types with no overall standard for what format images are saved in. The methods for creating images, however, fall into just two major classes: vector and raster. Each has special advantages.

Paint packages create raster, or bit-mapped, files by using hardware to define the grid of dots that compose an image. Each dot has a specific color. One big advantage of bit maps is that you can edit each pixel in the array of dots. And because you can manipulate these dots, you can mix them the way an artist might mix paints on a canvas. Developers have learned to do wonders with the bit-mapping concept: Witness the new programs that come close to electronically simulating the properties of real paint. The resolution of these device-dependent image files is limited to that of the display used to create

them, and the resolution of the output device determines the final quality of the image.

Vector files are used by programs that generate line-oriented art; CAD packages and technical illustration products typically fall in this category. Vector files are object-oriented and, as such, are composed of a series of instructions—for point-to-point lines or circles, for example—that are placed at specific positions. A shape, pattern, or shading is described by a formula or code and assembled into lists of geometrical abstractions. Vector graphics are device-independent. Object-oriented graphics can be scaled without distortion and can be printed at the highest resolution of the output device. Their object orientation makes vector programs ideal for the precision drawing needed by engineers, architects, designers, and others working on the geometric planes.

How An Unlimited Imagination Thrives On A Limited Budget.

The world's most-persuasive graphics software is now the most-affordable. CA-Cricket Presents is now just \$199, and CA-Cricket Graph is only \$129.

It's fast, easy and fully integrated. It's CA-Cricket® Presents™ and it has every feature you need to bring your ideas to life.

A built-in outliner so you can organize your thoughts. Predesigned graphic templates. An electronic light table to edit and re-sequence

your presentation. Plus speaker's notes and presentation-quality handouts and transparencies. And as you can see, you can even import graphics and scanned images from a wide variety of file formats

CA's Computing Architecture For The 90s.

including TIFF, CGM, Windows Metafile, Encapsulated PostScript and ASCII Text Files.

Need graphs for the slide show? Switch over to CA-Cricket® Graph™. It comes with a selection of twelve graph types, plus all the color and fonts you need. With just a few clicks of the mouse, you'll have the charts and graphs that'll make your presentations shine.

So call 1-800-645-3003 today for the location of your nearest dealer.

fixes in an upgrade already in the works.

For the person just getting into computer graphics, MacDraw Pro is a good choice. It's easy to learn and use and you can get sharp results without hauling yourself up the steep learning curve of a PostScript package. But before you join on, be aware that you'll need at least 4 MB of memory to burn—and a fairly stout Mac.

For users who need to produce professional-looking images but have little artistic ability, MacDraw Pro provides a strong alternative to Adobe Illustrator and Aldus FreeHand.

—D. B.

MICHAEL'S DRAW 1.0

Michael's Draw, an object-based drawing program with an unusual name, is a straightforward package for generating line-oriented artwork and twiddling text with special effects. The package has the standard tools for drawing geometric shapes, polygons, and lines. A nice complement of reshaping functions let you skew objects, shear them, and add perspective. A handy Copy tool automatically replicates a selected object, which can save you repeated trips to the copy/paste menu while you're attempting to clone a particular element.

To create complex drawings, the program relies on layering and "script" commands. The procedure, which involves creating scripted images by compiling a montage of layers into a single picture, requires careful reading of the manual.

The program also offers a considerable number of tools for manipulating text. It's easy to wrap text around a shape, have it follow the curve of a line, or flow a block of type into a particular shape. You can add color to text and achieve smooth gradations of color between the first and last letters. Although not as sophisticated as most desktop publishing programs, Michael's Draw has good typographic controls. A well-designed

Let's Be Sure Our Children Grow Up Smart And Fit.

We know our children won't get very far in the world without a good, working knowledge of the "3 R's." That's why school is such an important part of their lives. But there's another part of their education that's just as important to their future — physical education.

The healthy hearts they develop now will go a long way toward helping them grow into healthy adults. And the good fitness habits they learn can stay with them for a lifetime. So let's encourage our children to exercise their minds.

But let's be sure they do the same for their bodies.

The President's Council on Physical Fitness and Sports

*Fitness is
Feeling GREAT!*

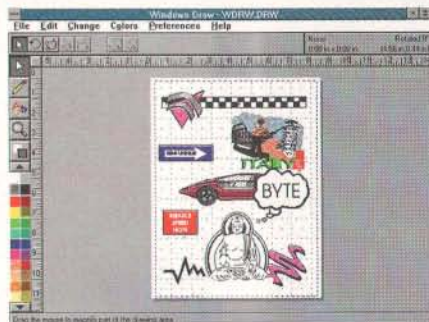

BUSINESS GRAPHICS

dialog box makes it easy to adjust the spacing between characters.

In keeping with its individualistic moniker, Michael's Draw has an individualistic interface. That interface is intuitive enough, but it sometimes departs from the conventions of other Mac drawing programs. The differences are subtle—the use of heavy frames around selected items, for example—but getting used to the program's look and feel can take a while.

This is a capable package that's more than adequate for producing heavily geometric designs and generating text with special effects. Even though Michael's Draw doesn't really do anything unique, it's fairly priced, isn't a resource hog, and is easy to learn and use.

—D. B.

WINDOWS DRAW 1.0

Micrografx Designer has received most of the attention, but the company's low-end drawing program, Windows Draw, has a number of fine qualities: It is intuitive, easy to use, and smart. This Windows-based package comes with more than 2600 vector-based clip art images, which you can reshape, customize, move, and rotate with ease.

Running in 24-bit color graphics mode, Windows Draw offers 16 million colors, from which you may select a 64-color palette. You can create your own bit-mapped fill pattern by editing magnified pixels; your editing changes are visible on-screen immediately.

The rotation tool is ingenious. You establish a focal point for the rotation by positioning the cursor near the object and clicking; then you use the mouse to rotate the cursor—left or right—until the object is in the correct position. Special effects include slanting, color blending, stretching, and the ability to wrap text around objects and apply custom gradient styles.

To know instantly the function of each icon or to name a color, you simply

It's Time To Think About America's Biggest Business Coverup.

Today's business is covered in paper. It's piled on desks, lost in files and burying good ideas alive. That's why we created WordScan™ and WordScan Plus for Windows. The award-winning Optical Character Recognition technology that eliminates the slow process of manually typing documents into your PC. WordScan converts any

document into text that can be read by word processing, desktop publishing and spreadsheet programs (no typist can equal 1200 words per minute or our industry leading accuracy). So you can integrate the information into your own work, ready in moments for revisions, retrieval and E-mail. Call us for details.

point to it with the mouse; a hint line at the bottom of the screen provides information about the item in question. The documentation for Windows Draw is excellent, and its pictorial index of all clip art names is especially helpful. In short, this \$149.95 package is a superb value.

—D. E.

PAINTING

Software has come a long way since the dawn of MacPaint, which truly was a marvel in its day. Not only can paint packages now take advantage of 16 million colors, far more than most anyone needs, these days some of them work more like traditional artistic tools. Creative designers who thus far have resisted doing graphics on personal computers are being won over by the power of these programs, especially once they realize they can save time and money by working in an electronic medium. If your business graphics requirements involve colorful, fluid designs that aren't limited to the rules of geometry, you'll be well served by one of the following paint programs.

COLOR IT 1.0

This bargain-priced 24-bit color paint program will appeal to anyone who likes the feel of working with watercolors. With its brush-control functions and ability to fine-tune the opacity of paint, Color It closely simulates the feel of working with traditional media. With the right adjustments, the tools take on a watery, fluid feel.

You can also lay color on thick, but one of the program's most appealing aspects is its ability to go lightly. With the nifty Smudge tool, you can easily blend the colors in a picture (imagine running your finger through wet paint). Sharpen and Blur let you harden or soften the edges of an image.

The various color palettes let you choose from the usual grid of 16 pigments and 256 gray scales, or from a color wheel. You can also set up your own customized palettes. The pattern set, to which you can add patterns of your own making, includes some designs not found in other Mac painting programs—among them, ack!, an array of yellow happy faces.

Color It is more than a program for painting original graphics. It's also nicely equipped for editing scanned images, which you then can place in a desktop-published document, for example. It isn't quite Adobe's PhotoShop, but the program has more than adequate tools for fixing up images, including brightness and contrast adjusters, edge sharpeners, and other filters and special effects. Despite its name, Color It is a fine gray-scale editor, too.

I found two things I could do without, however: an odd gradient-fill tool that kept filling the entire work area instead of the selected object and a delete function that wiped the entire image off the screen (praise be the undo function).

In some ways, this is more of a free-form artist's package than a corporate graphics program. But with its capabilities for enhancing scanned images, Color It provides editing and coloring functions that will appeal to the business artist who wants to add zing to documents and brochures. Best of all, the package is priced at \$119.95, proof that really slick software doesn't have to cost a lot. Truly a remarkable deal.

—D. B.

DR. HALO IV IMAGING PAK 1.0

Media Cybernetics' paint and graphic editing package, Dr. Halo IV Imaging Pak comprises six distinct modules: drawing program, viewer, presentation program, TSR screen grabber program,

font editor, and image-conversion utility. But the program is showing its age; it isn't as well integrated as many comparable programs. Singly, the utilities are quite powerful, but the package lacks a unified menu structure, so you must run each utility program separately.

Dr. Halo IV's drawing tools are easy to use, but the screen icons are small and cryptic. And although you can easily position text in any image, the program doesn't provide a text editor. Worthwhile features include unique tools that let you create sunburst effects with all the colors in the screen palette and a very handy TSR screen grabber. The program also is versatile enough to let you capture a DOS screen from within almost any application and save it as a TIFF or PCX file.

Despite shortcomings, this \$140 package is adequate for doing basic freehand drawing and editing graphics. A complete installation requires 3.7 MB of disk space.

—S. W.

GRAPHICWAY 1.0

Graphicway is a Windows-based program that's one-half drawing and one-half charting package. All the standard paint, drawing, graphing, and presentation tools are included, and the components are well integrated. Every tool and function is available from the icon display and from the menus.

An extensive clip art library also comes in the package; in it, you'll find library subdirectories for architecture, geography, graphic elements such as geometric shapes, and backgrounds, food and animals, signs, and symbols—including many for electronic schematics. Much of the clip art is rather simple, which makes it perfect for slide presentations and charts. But the package also contains many examples of animated art.

Graphicway's file handling is very good. It's easy to select and display directories, and you can call up a preview window for viewing images prior to editing them. Installation is simple; the package even creates its own group under Windows. A complete installation requires 8.2 MB of disk space. Tilcom Software sells several versions of the product: a run-time version is \$149, a presentation version that includes provision for creating slide shows is \$495, and a developer version is \$695.

Graphicway is a complete business package that tries to do it all.

—S. W.

If there were a printer that could give you this kind of color, would you still make your presentations in black and white?

Do your business presentations go in one eye and out the other? The Colormate™ PS can easily and affordably give them the impact they deserve. Enhancing your work with truly amazing color, from brilliant primaries to soft pastels. All Pantone® approved.

The Colormate PS integrates readily with any network, PC or Mac. And it's compatible with most popular business presentation and graphics software. Of course, Adobe® PostScript® is standard. The Colormate PS comes in two

models—the economical Model 40 with 4MB of memory and 17 resident fonts, and the fully featured Model 80 with 8MB of memory and 35 resident fonts. Both feature reliable 300 DPI thermal transfer technology.

For your free Color Presentations Guide and more information, call 1-800-NEC-INFO. Or call NEC FastFacts, 1-800-366-0476, document #26567, for info via fax.

After all, the world isn't black and white, why should your presentations be?

PAINTER 1.0

Working with this amazing paint program for the Mac and Windows seems almost like working with the real thing. Fractal Design has developed software that comes close to replicating the feel of working with a variety of traditional artistic media. The toolbox includes everything you'd find in a well-equipped studio: a selection of brushes, colored pencils, chalks, charcoals, calligraphy pens, felt-tipped pens, crayons, and an airbrush.

More significant, the tools generally work the way their nonelectronic counterparts do. If you take the pencil, say, and make a quick stroke, you get a light line on the screen. Bear down on a pastel chalk, and you get a broad smudge. Rub a yellow felt tip pen against black ink and the yellow gets "dirty." Each tool can be adjusted to provide different effects. You can dilute colors or blur an image by dropping "water" on it. This 24-bit paint program employs the HSV (hue, saturation, value) color system and an easy-to-use color wheel for choosing colors. As you apply more color to a region, it gets darker and denser—exactly what you'd expect in real life. Because their tools are pressure sensitive, both versions of Painter are best used with a pen and tablet (I used a Wacom digitizer). You can use a mouse, but drawing with a brick doesn't do this package justice.

The work space allows you to simulate painting or drawing on different types of paper and illustration board, offering you a wide range of grains and textures from which to choose. The paper you select determines, for instance, how a brush or other tool lays down paint or ink.

The tools are all reasonably responsive, particularly if you've got an accelerated Mac. Sometimes, though, you can end up a few steps ahead of the screen; even on a Mac with a Radius Rocket, the screen was a few seconds behind what I was doing on the tablet. The package doesn't include tools for altering the appearance of text.

You have to work with Painter to really

appreciate it. Although it's geared toward experienced artists, even people who haven't picked up a paintbrush since grade school are impressed by the way it simulates traditional tools. Businesses that want unique, eye-catching graphics ought to put this in the hands of their designers. But beware: Productivity might drop, as users are inclined to get caught up exploring this remarkable electronic art studio. At \$299, it's worth every penny. Painter is too cool for words.

—D. B.

PC PAINTBRUSH IV PLUS 2.0

DOS-based PC Paintbrush IV Plus, the latest version of an old standard, is a painting and image-editing program. The \$240 package can work with both PCX and TIFF files and supports 8-bit color images.

PC Paintbrush's principal strength is image enhancement. It provides seven special-effects tools that control blending, smudging, gradient fill, tiling, tinting, brightness and contrast. These tools can be used to change all or part of a graphic image, and you may enhance an image using outlining and shadowing. Or you may reduce a graphic element by as much as 25 percent or enlarge it by as much as 400 percent. PC Paintbrush's repertoire also includes the ability to overlay images and the ability to zoom in and out to provide detailed editing of graphic elements.

PC Paintbrush is optimized for use with a long list of scanners, both stand-alone and hand-held. You can control a scanner from the file menu and capture black-and-white or color images. The scanner setup options include settings for brightness, contrast, image type, resolution, and scaling. The program defaults to a 4- by 4-inch size, but you can enlarge or reduce this. Unfortunately, it is very difficult to paste two images together if you have to use multiple scans of a large image.

This is a good, basic picture-editing program. But its limitations are evident when compared to one of the newer Windows packages, such as ZSoft's own PhotoFinish. Still, PC Paintbrush IV Plus is easy to use, and if you follow the tutorial, you'll be drawing and painting in no time.

—S. W.

PUBLISHER'S PAINTBRUSH 2.0

Publisher's Paintbrush 2.0, ZSoft's Windows-based big brother to PC Paintbrush IV Plus, is an expanded painting and image-editing package. This \$495 update now supports 24-bit color files and can display 256 shades of gray and 16.7 million colors. Version 2.0 supports a variety of scanners as well as several devices used for color calibration.

The package makes more intelligent use of Windows than did previous versions. By supporting the Multiple Document Interface, the program lets you open multiple graphic-image files and reduce them to icons when you don't need them open on-screen. The initial screen display shows a toolbox of 42 tools, which may be grouped into 24 primary icons with pull-down secondary icons. You can rearrange the location of the tools on the screen to suit your needs. If you think the brush width and color palettes take too much screen space, you may move, fold, or hide them. If you have a particular set of tools you prefer to work with, you can save that combination of tools as a personal workspace.

The package's standard drawing tools are extremely powerful. ZSoft supports both its own proprietary fonts and URW outlines. You can enter and edit text in a dialog box. Publisher's Paintbrush has very strong import/export capabilities, but it relies heavily on the older 8-bit PCX format.

Publisher's Paintbrush also is optimized for use with scanners. It is compatible with a long list of scanners, both stand-alone and hand-held models. A complete installation requires 7 MB of hard disk space. Publisher's Paintbrush provides advanced graphic image editing capabilities for PC users running Windows.

—S.W.

SPLASH

Splash from Spinnaker Software is small, quick, inexpensive, useful, and a delight to use. Although definitely not a

Effortlessly contour and colormap surfaces generated from random sample points.

Pull a lever to adjust a variable, as the revolutionary Graphics Equalizer™ animates changes to your curve-fits and formulas on-screen.

Automate your presentation with master slides, outline, speaker & handout notes.

View and organize entire presentations at a glance with the visual slide sorter.

Pop up the extraordinary graph gallery of over 160 business, technical, and statistical graph types.

Access your numbers instantly from your favorite Windows or DOS spreadsheet.

Hot-link multiple data files directly to Stanford Graphics' proprietary 4-D 70-trillion cell spreadsheet.

Animate the 3-D rotation of your graph and its actual data.

Instantly identify & modify your data points with the Intelligent Data Cursor™. Simply drag a bar or line to change a cell in your spreadsheet!

Click on the Calculator for on-the-fly business, financial or scientific computations.

STANFORD GRAPHICS FOR WINDOWS

Finally...presentation graphics with numerical clout!

Does your presentation software give you all beauty and no brains? Where is the substance behind those pretty pictures? What if your presentation program had enough data-handling muscle to meet the needs of business and statistical and scientific users?

Presenting Stanford Graphics for Windows, the first graphics package to offer both state-of-the-art presentation features and powerful analysis capabilities.

With on-screen curve fitting, formula solving, statistics, and data manipulation, Stanford Graphics advances both the art and science of technical presentations.

"Stanford Graphics offers the best of both worlds. It combines top-notch presentation features with unprecedented technical sophistication. We were greatly impressed."

—Infoworld,
Sept. 16, 1991

STANFORD GRAPHICS™

PRESENTATION & ANALYSIS

All this and Windows too. Stanford Graphics takes full advantage of the latest in Windows 3.0 and 3.1 technology, with sophisticated DDE, OLE, and TrueType font support.

Stanford Graphics for Windows:
Presentation and Analysis.

high-powered graphics program, this VGA-only package is just right for touching up and annotating TIFF files from other programs.

Useful features include an easily changeable 256-color palette and the ability to digitize signals from a Digital Vision ComputerEyes video digitizer. Shortcomings include a user interface that beeps when you perform a function properly and a limited zoom capability. The zoom function has only two sizes:

normal and zoomed. When you zoom in, you get a close-up look at a portion of the larger image.

If you are on a tight budget, don't do a lot of drawing, or have children who like to draw, Splash is well worth exploring. The \$39.95 price simply cannot be beat.

—R. C.

CHARTING AND GRAPHING

Charts and graphs are the mainstays of business graphics. Any serious enterprise

needs to produce them at some time, for use in annual reports, business plans, promotional materials, internal financial documents, and presentations. Although many of the popular spreadsheet programs are quite astute at generating good-looking graphs, sometimes the situation calls for something more sophisticated or more creative. Also, not everyone is a spreadsheet user. Whether you need to generate charts and graphs from raw data or from cells imported from a spreadsheet package, there's a wide choice of programs that can make your visual information look professional and appealing. Mac users have an advantage here in that the better charting tools currently run on that machine. Obviously, the Mac has become a serious business computer.

LAN's Best Friend

Back-UPS™ are the best value in LAN power protection

According to a recent issue of PC Magazine "You should buy UPS protection for every server, wiring hub, and bridge or router on the network. Since you don't need excessively large or expensive products...back up networked clients too."

Protection for:
Novell
IBM LAN
Server
3-Com
LAN Manager
SCO Unix
Banyan
AppleShare

Eliminating power problems with a quality Uninterruptible Power Supply is the most dramatic step you can take towards increasing LAN uptime. The cost-effective Back-UPS™ Series offers solutions for your largest superserver down to your smallest router. With performance that has earned uninterrupted applause from users and editors alike, it's no wonder that APC protects more LANs than any other brand of UPS. Call for a free LAN Protection Handbook.

ABC FLOWCHARTER 1.13

As a Windows-based diagramming and charting program, Roykore's ABC Flowcharter provides a means of tracking procedural flow. The program's ability to link charts with chart shapes lets you create complex, hierarchical flowcharts, which you navigate by double-clicking on a chart icon and displaying the linked chart. A unique navigational grid above the vertical scroll bar moves the window image in each of the compass directions.

Flowcharter takes advantage of the Windows environment by providing complete control of most display options. You can control color, line width and style, shadowing, fill colors and patterns, and text format. The program's Fit Shape feature automatically adjusts the symbol size to display all the text. Unfortunately, the text is not contoured to the symbol shape, and text does not fit well within nonrectangular symbols. Circles and triangles, for instance, often are displayed with text extending beyond the borders.

Since Flowcharter supports Windows 2.11 as well as 3.0, it does not use the

"PacificPage swiftly and accurately renders some test EPS files that other interpreters distort, and had no trouble with any of the large and complex images I used for testing."

"An Intel i960™ RISC processor on the accelerator board helps the PacificPage XL print graphics more than six times as fast as the HP PostScript Cartridge"

Edward Mendelson
PC Magazine, (June 25, 1991)

Don't settle for less just to buy the Hewlett-Packard name. Ask for PacificPage PostScript® language emulation solutions from Pacific Data Products. You'll get a lot more, for a lot less.

Each PacificPage product for LaserJet® II, IIP, IIP Plus, IID*, III, IIID, and IIIP printers is guaranteed to be completely compatible with all of your PostScript output. If you can create it, PacificPage can print it. If not, we'll give you your money back.

Choose from PacificPage PE or PacificPage II (ver. 5.0), our fastest stand-alone cartridges ever. Or PacificPage PE/XL and II/XL which combine the PacificPage cartridges with a RISC-based accelerator board. Just slip the board into the LaserJet memory slot and you'll experience an incredible increase in printing speed. If you purchase one of the PacificPage cartridges alone and find that your printing applications demand even greater speed, simply upgrade to the XL version.

Why not get more for less? Buy a PacificPage cartridge and save more than \$500 over Hewlett-Packard. Or, save close to \$200 over Hewlett-Packard with an XL version and amaze yourself with its speed. Make the smart choice. Choose PacificPage.

For more information call your nearest dealer or contact Pacific Data Products, 9125 Rehco Road, San Diego, CA 92121, USA. (619) 597-4607, Fax (619) 552-0889.

standard Windows help interface. The custom help interface is confusing because the index is arranged in topical rather than alphabetical order. Looking for answers to a particular question requires a lot of manual scanning. Another significant drawback is that, when I ran it in 1024 by 768 graphics mode, Flowcharter repeatedly lost pieces of symbols. The edges of the symbols weren't always drawn. This problem did not appear in standard 640 by 480 graphics mode.

Except for the improperly drawn symbols, the \$295 ABC Flowcharter performed smoothly and well. It felt comfortable to use and interaction was intuitive.

—R.C.

CA-CRICKET GRAPH

CA-Cricket Graph from Computer Associates International is a chart-creation and presentation package for both Microsoft Windows and the Macintosh (versions 1.3.1 and 1.3.2, respectively). You enter data in a spreadsheet before converting it into a chart. The spreadsheet function has limited high-end computational capabilities. Unlike normal spreadsheets that allow formulae to be associated with a single cell, Cricket Graph's calculations consist of taking the values in one column, performing a calculation, and placing the results in another column. In addition to simple mathematical calculations, Cricket also supports advanced functions such as logarithms, exponential powers, and sine/cosine. Logarithmic and polar graph formats are supported, as well.

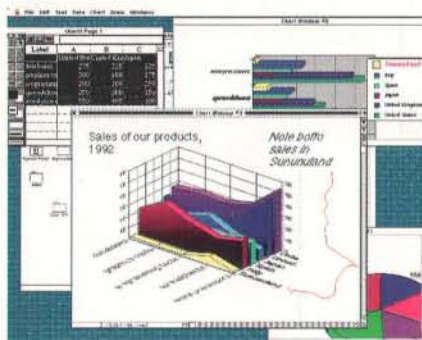

Once you enter all the data, creating a graph is quick and simple. After selecting the type of graph to create, you select your x and y axes from a dialog box and the graph is displayed. All the default graph layouts are aesthetically pleasing. Cricket allows all aspects of the displayed charts to be manipulated: colors, hatch patterns, fonts, and so on. The Windows

version of the package comes with its own set of 11 high-quality display fonts. In addition to changing colors and styles, you may move and resize each graph element. One of the nicest features is that Cricket Graph lets you move slices of pie charts around for emphasis by simply clicking and dragging on the slice.

One of Cricket's drawbacks is its failure to interactively link the spreadsheet and the displayed graph. Changing the spreadsheet data does not change the graph. Another problem is the program's execution speed under Windows. Although the graph drawing speed on the Macintosh was quite comfortable, the response time under Windows was much slower, even on a 20-MHz 486SX.

If your main requirement is creating nice looking graphs, and you really don't need the power (or expense) of a spreadsheet, then the \$129 CA-Cricket Graph is an affordable solution.

—R.C.

DELTAGRAPH PROFESSIONAL 2.0

DeltaPoint's excellent charting program for the Mac will help you generate good-looking, colorful graphs with little hassle. You can enter the data using the program's own columns-and-rows worksheet, which comes up when you open the program, or import data from your usual spreadsheet. Select the data, click on the Plot icon, pick the type of chart you want, then click a button to produce a chart in a separate window. You then can work directly on the chart sheet to change the way it looks. Each element (bar, line, text, and so on) is an object, so you just double-click anything you want to change. Needless to say, this setup makes it very easy to manipulate anything within a chart.

DeltaGraph Pro can generate just about any type of chart you'd want—from standard business graphs to scientific graphs. All told, the package offers 38

varieties, including 10 three-dimensional types and some esoteric kinds such as polar and spider charts. The program lets you have multiple windows associated with each data sheet, so you can have a bunch of different graphs of the same material up on the screen, if you're unsure which graph is most appropriate.

DeltaGraph Professional's color capabilities are considerable. With the shading functions and some other effects, you can design visually sophisticated graphical and textual charts. A set of drawing tools enables you to annotate graphs; another collection of tools lets you set up slide shows.

DeltaGraph Pro takes full advantage of System 7, including Publish and Subscribe. Special hooks are provided to Excel, so you can establish active links between spreadsheet files and DeltaGraph charts. Excel users who'd like a more sophisticated graphing tool than Excel provides should check out the full-featured charting of DeltaGraph Pro.

At \$295, DeltaGraph Pro is a good deal. Any functions it's missing are too obscure to concern most business graphers. Best of all, it's easy to use. And the results look good enough to make even a chart full of declining revenues seem less depressing.

—D.B.

EXPRESS PRESENTER 1.0

Power Up Software's Express Presenter charting package provides a fast and efficient way to create 35mm slides and on-screen presentations. Express Presenter can handle 13 chart types that range from outlines and bulleted lists of information to bar, pie, and line charts.

The charts fall into three categories: data, graphical, and annotated. In data mode, you enter information into predefined fields such as title, subtitle, and bullet. Graphic mode automatically translates the data into a presentation-quality screen according to the rules stored in definable style sheets. Annotate mode permits you to place additional text, graphics, and clip art on a slide, and you can overlay charts on each other. Groups of slides may be gathered into slide shows for real-time presentations.

If you've ever felt embarrassed by presentations with misspellings, then you'll love the built-in spelling checker. Unfortunately, you cannot spell-check an entire set of slides with one command. You must check each slide individually.

Express Presenter sells for \$199.95 and

Circle 12 on Inquiry Card.

arrives with several hundred useful clip art images arranged in four files. Only one of these four files may be used at a time. Oddly, to switch from one clip art group to another, you must first quit the program and start it up again, selecting the clip art file you want to look at and loading it. But this is the only awkward feature in an otherwise easy-to-use program.

—R. C.

GRAPH-IN-THE-BOX EXECUTIVE 1.14

Graph-in-the-Box Executive for DOS is a TSR program that lets you capture numerical data from a screen display within another program and use that data to create as many as 15 different types of graphs. The TSR occupies only 10 KB of memory when inactive.

Graph-in-the-Box is simple to operate. After you run the Graph program, you run a DOS application—a spreadsheet, for example—and then invoke the graphing TSR to capture a portion of the screen. Then you quit your DOS application and use the program's Graph module to quickly and easily create a graph.

One of the first PC graphing tools, Graph-in-the-Box isn't as sophisticated as some high-end packages now on the market, but it does allow you to capture data from a wide variety of DOS programs. The \$299 program requires 1 MB of disk space for a complete installation. New England Software also sells a Windows and a network version of the product.

—S. W.

GRAPHMASTER 1.31

GraphMaster, Visual Business Systems' charting program for the Macintosh, is similar to DeltaGraph Pro in that it has a big selection of graph types, uses a spreadsheet-like form for entering data, is very flexible at manipulating data, uses

24 bits of color, and can produce charts that look really good. You can choose from 13 basic chart types (each of which has several variants), including the usual bar/column styles and some statistical/scientific types, such as polar graphs and histograms. Most of them can be represented in 3-D format.

The big difference between the two products lies in the way they operate. DeltaGraph Pro—for me, at least—is a bit more graceful. For example, with DeltaGraph, if you want to try out different types of charts for the same data, you just click on the Plot button and the program automatically opens up a new window for that new chart. With GraphMaster, you must open up a new page before plotting your graph; otherwise, the new chart gets plunked down on top of the one already on the screen. That doesn't present insurmountable obstacles, but it would be nice if GraphMaster got rid of the extra step.

When it comes to working on a chart, though, GraphMaster shines. Besides letting you easily change any element—once you get used to the method of selecting individual elements—the program provides a few spiffy features: gradient backgrounds, color shades, and pictograms (images based on PICT or EPS drawings). You'll even find a set of object-based drawing tools. In fact, it's so easy to customize a chart that it's hard to leave well enough alone.

GraphMaster has numerous data-manipulation functions, including sorting and transposing, and it comes with its own language for developing formulas. The program maintains links between the data window and the related chart; if you make a change to the data, the graph is updated automatically. GraphMaster also can establish a link to data in an Excel spreadsheet. With version 1.3, it fully supports System 7, including Publish and Subscribe, Data Access Language queries, and AppleEvents.

Despite its sometimes unusual procedures, this is an excellent tool that can generate just about any kind of presentation-quality chart or graph a business would need. At \$295, it's a good buy.

—D. B.

INSTANT ORGCHARTING 1.0

Instant ORGcharting, another charting program from Roykore Inc., is exactly what its name implies—a method of creating presentation-quality organizational

charts in record time. Although it is similar in some ways to the company's ABC Flowcharting product, Instant ORGcharting has a single purpose. This \$195 package manages all layout and positioning details for you, while still providing a wealth of options. And, if you don't like any of the nine default layouts, you may manually adjust them.

Each box on the organizational chart has a set of fields associated with it. You can add, delete, and rename these fields at will. Fields can be defined and displayed box by box or you can display an entire chart. Each organizational box may have both a bit-mapped picture and a note box, which are displayed automatically when you select a symbol. Although the documentation and examples are all centered around business/personnel charts, this product is suitable for diagramming any structured information, including hierarchical parts lists.

One excellent feature is the package's ability to import and export ASCII text files to create and edit organizational charts. This feature allows information to be quickly extracted from databases.

Instant ORGcharting allows only a single organizational chart to be open at a time. Its ability to link multiple charts into a hierarchical relationship is a major shortcoming. Although sufficient to create an organizational chart for BYTE's editorial department, a chart covering all of McGraw-Hill would be unwieldy.

Instant ORGcharting is fast and it's simple. An excellent choice for anyone who builds organizational charts more than once.

—R. C.

Taking Care of Business Graphics

Remember the childhood excitement of opening a new box of crayons? All those colors to choose from. All those nice, sharp points to work with. The prospect of opening up a new business graphics package can evoke a similar sort of excitement. Too often, though, that excitement is tempered by the fear that you might choose the wrong package.

We can't tell you what to buy, but we can offer a few straightforward guidelines on selecting the appropriate type of business graphics program: Buy an object-based drawing package for creating precise, line-oriented artwork; a painting package for free-form illustration or photo touch-ups; and a charting program for producing graphs (although drawing programs such as Adobe Illustrator also are very good at this).

Graphics software, like art, is highly

Touching the World

CTX Monitors:

Immortality. We each, in our own way, strive to leave our mark. Our own individual contribution to the planet.

CTX is helping you leave a lasting impression. By creating a brilliant line of monitors with unsurpassed crispness and quality, CTX is enhancing your vision.

CTX's 14" VGA products range from the non-interlaced low radiation Super VGA to Standard VGA and Monochrome. CTX monitors offer IBM and Macintosh compatibility, handy up-front controls, non-glare screens, detachable tilt/swivel bases and universal power supplies . . . plus reputable nationwide servicing and affordable pricing.

Recently added to CTX's new product line are large screen 15", 17", and 21" monitors, featuring flat screen technology and programmable screen controls. Now you know that CTX is your link to the future.

Let a CTX monitor bring your own personal greatness into view. Contact your nearest CTX dealer today. OEM accounts are also welcome.

Circle 13 on Inquiry Card (RESELLERS: 14).

subjective. Each of us has our favorites, based on what a program can do and how it does it. Professional artists tend to prefer Adobe Illustrator, Aldus FreeHand, and CorelDraw. For those less artistically inclined, the market offers a range of easy-to-use packages—such as Harvard Draw for Windows and Windows Draw—that produce good-looking images.

In the realm of painting, the very capable and inexpensive Splash deserves mention. For painting originals or retouching scanned images on the Mac, fun-to-use, bargain-priced Color It is remarkable. On the Windows side, Publisher's Paintbrush is comparable as an image editor, but it doesn't have the fluid feel of Color It. If you want to produce images that look as if you've lifted them off an easel or drawing table, Painter is a

masterpiece. If you're going to work on technical as well as free-form illustrations, check out Canvas 3.0, which can handle either type of art. For charting and graphing, DeltaGraph Professional and GraphMaster both are winners on the Mac. If you're running Windows, CA-Cricket Graph looks like the best choice for right now.

None of these packages will give you the skill or aesthetic sense of DaVinci, but they can compensate for such basic artistic shortcomings as the inability to draw a straight line. And they can save artists a great deal of designing time. No matter what your business graphics requirements, you'll find plenty of powerful software to satisfy them, but before you settle on a particular program, get a test drive to make sure it can do what you need done. The ulti-

mate buying decision, like your choice of which crayon to use first, really is up to you. ■

Stan Wszola, a BYTE Lab testing editor, is a veteran DOS user. David L. Edwards is a consulting editor for the BYTE Lab. Raymond GA Côté is continuing his 15-year love affair with computers as tools and toys. He has extensive experience as a software developer and designer of interpretive languages and user interfaces. Tom Thompson is a BYTE senior editor at large. He holds a B.S.E.E. from Memphis State University and is a certified Mac developer. D. Barker, an art school dropout, is the BYTE Lab editor handling applications software reviews. You can reach them on BIX as "stan," "dedwards," "rgacote," "tom_thompson," and "dbarker," respectively.

Software Digest

RATINGS REPORT

The Independent Comparative Ratings Report
for Selecting IBM PC-Business Software

Volume 6, Number 5

STATISTICS PROGRAMS

Statistical programs present a high degree of complexity that limits their use. Some of the test programs have been modified to minimize that complexity, but to a large extent they remain complicated. Programs originating in mainframe environments make few concessions to the PC environment and PC users.

- Systat balances power and usability. SAS provides great power to users who master it, and Statgraphics is the easiest to learn and use. NISTL does not recommend the other programs for PC use except in businesses already running the mainframe version.
- Four of the statistics packages are sold as modules, and prices range from \$200 to over \$4,000 for a complete set. Refer to the Program Module Chart on page 10.

Contrary to the common belief among statisticians, great differences in calculation speed separate the programs. Calculation speed can be very important to users who run frequent analysis of large data sets. (Performance Results, page 32).

Place this report in your binder behind the Miscellaneous Software tab divider.

If you need statistical software,
this is a statistic you should know.

SYSTAT is rated #1 by Software Digest®. In fact, SYSTAT is the only statistical analysis package to receive top honors from InfoWorld, PC Magazine and PC Week. According to Software Digest: "It is the only program that successfully blends robust features, good usability and performance, and many areas of uncommon strength from analytical graphs to powerful programming."

SYSTAT. The statistics speak for themselves.

How Can Northgate® Offer You A 386SX™/16 Color System Plus Expert Support For Only \$1699?

Like Stonehenge, Some Phenomena May Never Be Explained.

Mankind has a long, fascinating history of combining ingenuity and dedication to building items that can only be described as phenomenal. Like Northgate's high-performance 386SX/16 system.

Created from the ground up, this modern wonder takes powerful 386SX performance to new

levels with its impressive engineering, support and value.

Take a look:

- 386SX/16MHz processor
- 2MB RAM; expands to 16MB
- 52MB IDE hard drive with 17ms seek time
- 1.2MB 5.25" and 1.44MB 3.5" floppy drives
- Space-saving 5-bay desktop case
- Six 16-bit expansion card slots
- 14" SVGA monitor
- Exclusive OmniKey® keyboard

- MS-DOS® 5.0
- DiagSoft™ QA Plus™ system diagnostic/performance software
- FCC Class B Certified

But what's really phenomenal... you also get 24-hour 7-day-a-week toll-free technical support, a limited one year parts and labor warranty with on-site hardware service from NCR® (second and third year plans available), and overnight shipment of replacement parts at our expense during the

Rising up from Salisbury Plain in England, Stonehenge is a mystery. Theories about its creation include a primitive "duplication" of Roman architecture to an observatory for tracking the movement of stars. Even more intriguing is how the ancient craftsmen could move the massive blocks, stand them up and balance another stone on top of the pillars. And how were they able to perfectly align the stones so the sun would shine through particular columns during equinoxes? These mysteries may never be solved.

warranty period. When coupled with our 30-day money back guarantee, it's clear you have nothing to lose. And a phenomenal computing solution to gain.

TAKE THE "LOCAL" OUT OF YOUR AREA'S NETWORK.

Today's demands to share business information, resources and technologies mean that networks can no longer afford to be local. With LANMODEM™ from Microtest, there is no reason to limit the area of your network. ⚡ **LANMODEM opens the door to the outside world.**

As an intelligent network modem, LANMODEM gives authorized users transparent access to, from and between Novell™ LANs. And with the external serial port, a second modem can be attached to allow multiple users to dial-in and dial-out simultaneously. ⚡ **There's a universe of possibilities for LANMODEM.** Sales people can dial-in to upload today's orders or download timely account data to their laptop PC. Employees can dial-out to access bulletin boards, on-line information services and even other LANs. Service technicians can perform remote support and maintenance. Remote users can even run applications like spreadsheets and databases without remote control software—using

LANMODEM's FastLink™ direct IPX feature. ⚡ **The down-to-earth benefits of LANMODEM.** Cost effective: LANMODEM is an affordable network solution that delivers 9600 baud v.42bis communications and up to 57.6K bps via the

external serial port. *Compatibility:* Supports Ethernet™ (thin, thick and 10BASE-T), ARCNET™ and even 4/16 Mbps token ring. LANMODEM is also compatible with most network communications software, including popular remote control packages. *Innovative hardware/software design:* Security and utility software make management and installation easy. Plus Flash ROM allows LANMODEM to be upgraded instantly, without disconnecting it from the LAN. ⚡ **Now there's no reason to limit the area of your network.** For more

information on "what's in" on dialing-in and out of your LAN call Microtest at 1-800-LAN-9675.

SOFTWARE

LAN Manager 2.1 Opens the Gates

JON UDELL

Wide-area connectivity, solid Macintosh support, and client-side NetWare integration top the list of improvements that make the new version of LAN Manager the most impressive ever. Despite continuing confusion over the changing roles of DOS, Windows, and OS/2, Microsoft's network strategy is on target and should now begin to pay off. What's the strategy? Quite simply, to tear down barriers to Windows-oriented client/server computing.

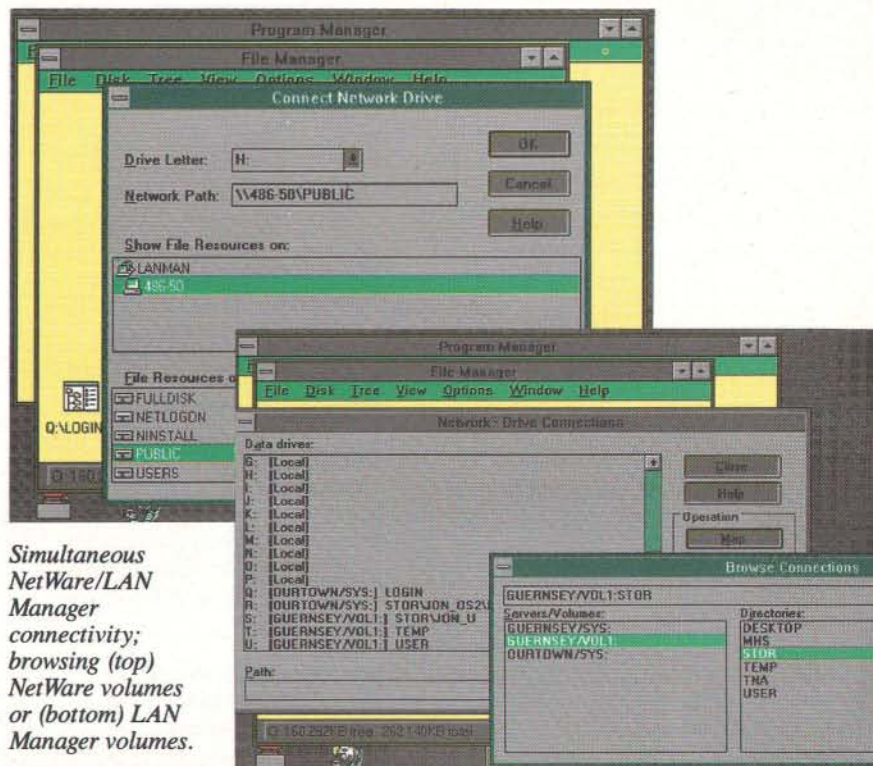

Tapping into TCP/IP

The TCP/IP protocol included with LAN Manager 2.1 is one key strategic move. Although I'm connected to a LAN Manager server as I write these words, there's no NetBEUI stack on my DOS/Windows machine—I'm using TCP/IP. The same transport code that carries files to the server carries icmp packets to BYTE's Unix workstations when I type ping. Microsoft doesn't ship, but plans to offer as a separate product, additional TCP/IP utilities such as telnet and ftp. If you need PC-to-Unix connectivity, you will love not having to burden DOS with an extra protocol to get it. Even if you don't do Unix, though, LAN Manager's ability to ride TCP/IP networks places serious long-haul connectivity within your reach.

LAN Manager 2.1 also comes with libraries that implement Berkeley Standard Distribution sockets for both DOS and OS/2. Although an SNMP agent that monitors a LAN Manager server is the only shipping Microsoft component that uses sockets, I welcome the implicit endorsement of an alternative to named pipes. Kudos to Microsoft for encouraging the development of client/server applications without mandating how they are built.

Remote Access Done Right

Remote access to a LAN can work two ways. From a modem-connected remote PC, you can either capture the screen and keyboard of a LAN workstation (remote control) or drive a true network connection through the phone line. Remote control can be very useful for training and for those aspects of network management

Simultaneous NetWare/LAN Manager connectivity; browsing (top) NetWare volumes or (bottom) LAN Manager volumes.

that involve "visiting" LAN workstations. However, it isn't really the right tool for remote database access, although it's often put to that task to compensate for non-client/server architectures.

LAN Manager's new Remote Access Service, by contrast, shines brightest in client/server applications. Like Unix SLIP (serial-line Internet Protocol) and Shiva's NetModem/E, it makes a serial port masquerade as a network adapter. You just load up another NDIS protocol, AsyBEUI, which stands for "asynchronous NetBEUI." Then you can dial up a LAN Manager server running AsyBEUI as one of its protocols and net use its drives and printers just as you would on an Ethernet connection. The LAN Manager server can accept asynchronous connections through its COM ports or by way of a multipoint adapter (several popular models are supported). Both DOS and OS/2 clients can dial into the server's Remote Access Service.

Naturally, unless you've got a pair of screaming modems in the circuit, simple file- and print-sharing activities move at a snail's pace. But client/server applications may hardly mind the slow link. I

ran the Windows-based administrative tool that comes with the latest release of SQL Server from my home DOS/Windows machine against a LAN Manager server at work. Because relatively small squirts of data passed between client and server—commands, acknowledgments, query results—the setup was very usable even over a 2400-bps connection.

There were two glitches. First, although you can have two simultaneous network connections, serial and Ethernet, LAN Manager's net send command didn't work in that situation. It reported a network adapter error. A Microsoft representative explained that many NetBIOS applications (although of those shipped with LAN Manager itself, only net send) become confused when they see two adapters. Evidently, the NetBIOS software base has some catching up to do. Second, I couldn't get DOS and Windows to do useful work during AsyBEUI transfers—the protocol processing yields virtually no cycles to other tasks.

Remote-access utilities include rasphone, a character-mode dialing program that you use to make and break connections, and rasadmin, a graphical

A MESSAGE To OUR SUBSCRIBERS

FROM TIME TO TIME WE make the BYTE subscriber list available to other companies who wish to send our subscribers material about their products. We take great care to screen these companies, choosing only those who are reputable, and whose products, services or information we feel would be of interest to you. Direct mail is an efficient medium for presenting the latest personal computer goods and services to our subscribers.

Many BYTE subscribers appreciate this controlled use of our mailing list, and look forward to finding information of interest to them in the mail. Used are our subscribers' names and addresses only (no other information we may have is ever given).

While we believe the distribution of this information is of benefit to our subscribers, we firmly respect the wishes of any subscriber who does not want to receive such promotional literature. Should you wish to restrict the use of your name, simply send your request to the following address.

BYTE Magazine

LAN MANAGER 2.1

administrative tool (for both Windows and Presentation Manager) that controls ports, users, and connections. Using rasadmin over a home-to-work connection, I activated the callback feature, and

the next time I dialed in, the server called me back.

Living with NetWare

Thanks to one more new NDIS protocol, DOS clients can connect simultaneously to LAN Manager and NetWare servers. When you install LAN Manager's new NetWare-connectivity feature, the setup program prompts for your SHGEN (or WSGEN) disk and builds an NDIS-compliant IPX.COM. Now you can load the NetWare and LAN Manager shells at the same time—a wonderfully convenient, if somewhat ungainly, arrangement. While I would rather see Microsoft and Novell cross-support SMB and NetWare Core Protocol in their servers, LAN Manager's client-side NetWare connectivity is a laudable step in the right direction.

What puts it a cut above other dual-shell solutions I've tried is the superb Windows integration. A new Windows network driver, DUALNET.DRV, sorts out access to the two flavors of network resources. When you select Connect to Network Drive in the File Manager, for example, the driver asks you to choose between LAN Manager and NetWare. Running Windows 3.1, I connected to drives on both servers and then used drag-and-drop to move files back and forth between them.

The same LAN Manager/NetWare choice appears when you select Printers in the Control Panel. I routed LPT1 through a NetWare queue to a LaserJet and LPT2 through a LAN Manager queue to a LaserWriter (on an AppleTalk network, actually), and then I monitored both queues in Print Manager.

All this juicy interoperability takes a predictable toll on DOS and Windows. Loading both shells brought free conventional memory down to about 470 KB. Windows had to load half a dozen VxDs to support the two networks in enhanced mode. I could unload either network shell, but I had to quit Windows first. When I restarted Windows minus one or the other of the shells, it still expected to see both and so complained about the missing one—although it ran fine. And, of course, I could only unload in the reverse order of loading; so, to switch from LAN Manager plus NetWare to NetWare alone, I had to unload two shells and then reload one. Ultimately, though, LAN Manager's NetWare-connectivity feature rises above the peculiarities of DOS and Windows. It's incredibly useful.

LAN Manager for Macintosh

The new Macintosh services, formerly available from 3Com but, thankfully,

BYTE ACTION SUMMARY

■ WHAT MICROSOFT LAN MANAGER 2.1 IS

The latest version of Microsoft's OS/2-based network operating system.

■ LIKES

TCP/IP and the Remote Access Service put wide-area client/server computing within reach. Macintosh and NetWare connectivity broaden LAN Manager's appeal immensely.

■ DISLIKES

The uncertain status of the underlying operating system, a Microsoft version of OS/2, makes life difficult for developers who want to write server applications today.

■ HARDWARE REQUIREMENTS

Server: 286 or higher; 9 MB of RAM recommended.
OS/2 workstation: 286 or higher; 4.5 MB of RAM recommended.
DOS workstation: 8086 or higher; 640 KB of RAM and extended/expanded memory recommended.

■ RECOMMENDATIONS

Use it alone, or in conjunction with NetWare, as a foundation for Windows-oriented client/server computing.

■ PRICES

Server software with 10-user license, \$1995
Unlimited user pack, \$5495
Macintosh services, \$995
Remote Access Service, \$1995
Visual Basic toolkit, \$135

Circle 1224 on Inquiry Card.

LAN MANAGER 2.1

now a standard option, worked flawlessly. Installation was a snap, in part because I didn't make the server a *seed router* and so didn't have to define AppleTalk zones and network numbers. My Ethernet-connected LAN Manager server talked to BYTE's AppleTalk LAN by way of a Cayman Systems GatorBox. Alternatively, I could have installed a LocalTalk adapter in the server and had LAN Manager do the Ethernet/LocalTalk routing. (Note that NetWare-style internal routing, never a feature of LAN Manager, still is not; you can't, for example, join token-ring and Ethernet segments at the server to create a single logical network.) The Mac services support a maximum of 50 users; that's a hard limit, related to the availability of threads in OS/2 1.x.

The file-sharing service, MacFile, works with existing LAN Manager user accounts, so there's no administrative overhead there. You do have to explicitly share out volumes. Permissions and filenames map across the cultural chasm pretty much as you'd expect, and there's one nice enhancement that NetWare for Macintosh doesn't provide. LAN Manager maintains a list of DOS file extensions and a mapping from these to Macintosh Type and Creator strings. So when I copied a .DBF file and a .TXT file to the server, Mac clients immediately saw these as FoxBase+ and Microsoft Word documents. You can use the mac-admin utility to change the mappings if, for example, you want Mac folks to see .TXT files as MindWrite documents instead. The same tool can also monitor active shares, which is handy.

The MacPrint service can export LAN Manager-connected printers to the Mac population, link PC users to AppleTalk-connected printers, and interpose queuing between Mac users and their own printers. Figuring out how to do all this can be confusing, in part because you have to make OS/2 and LAN Manager agree on printer and queue definitions. Eventually, I got everything to work. MacPrint caches LaserPrep files so Mac users needn't retransmit them, and it can "capture" AppleTalk printers so you can ensure spooled access and centralize job control.

Installation Central

Remote installation is an intriguing but frustrating feature of LAN Manager 2.1. You install the workstation software at the server and create a bootstrap disk. You boot a workstation from the disk, and it connects to the server and pulls the necessary files across the network.

But Microsoft failed to parameterize the installation so you can specify your version of DOS, your network adapter, and your adapter settings on the fly. Instead, the company recommends that you set up one directory on the server for each combination of these variables.

Visible Seams

The role of OS/2 remains problematic. To spare you the trouble of hunting for a compatible version of OS/2 to put underneath LAN Manager, Microsoft now includes a modified version of OS/2 1.3. Thanks to the LADDR (Layered Device Driver Architecture) extensions in this version, LAN Manager (and the new version of Sytos Plus bundled with it) works with a healthy variety of SCSI adapters.

Yet thick irony surrounds these welcome developments. With IBM leading the OS/2 charge and Microsoft advancing on the Windows NT front, it's hard to take Microsoft OS/2 1.3 seriously as a platform for the server parts of client/server applications.

OS/2's role confusion affects LAN Manager's client-side offerings as well. For historical reasons, OS/2 workstations have a number of advantages over DOS workstations in LAN Manager networks. For example, OS/2 clients can use server modem pools and can manage servers remotely; DOS clients can't. Yet sexy new features, like NetWare connectivity and over-the-network installation, aren't made available to OS/2 clients; they're for DOS/Windows clients only.

Utilities are another anomaly. The company whose strategy is "Windows, Windows, Windows" continues to lean on an awful lot of character-mode DOS utilities. Only rasadmin is a Windows program—and also an OS/2 program, by the way, thanks to the Windows Libraries for OS/2. This despite Microsoft's offering of a Visual Basic toolkit that encapsulates the LAN Manager application programming interface, to simplify development of Windows-based LAN Manager utilities.

Does Microsoft's shifting platform emphasis cast doubt on the future of LAN Manager? In principle, Windows NT should slide neatly under LAN Manager, but only time will tell. Meanwhile, I'm quite pleased with the 2.1 product. Key strategic advances—TCP/IP, remote access, Mac services, and NetWare connectivity—should make every savvy network integrator sit up and take notice. ■

HARDWARE

New MultiSyncs Prove That Flatter Is Better

ALAN JOCH

Although NEC's MultiSync sales have traditionally led the multi-scanning-monitor market, consumers are benefiting from a wave of monitors that offer larger screens, higher non-interlaced resolutions, faster refresh rates, and flatter displays than many of NEC's products. Sony's flat-panel Trinitron displays and Nanao's innovative FlexScan series, for example, have challenged the MultiSync's stature.

NEC's response is the new FG line, which updates the MultiSync line with new sizes, crisper displays, and innovative features such as a built-in color calibrator.

The Line

The FG line will replace NEC's existing MultiSync 3DS, 4DS, and 5D. The two new 15-inch FGs, the \$949 4FG and the stripped-down \$799 3FGx, began shipping late last year. At press time, two larger-screen versions came to market: the 17-inch 5FG and a 21-inch 6FG. Both the \$1699 5FG and the \$3499 6FG display up to 1280 by 1024 pixels at 74 Hz noninterlaced.

An optional slip-on lens reduces glare and improves contrast in the MultiSync 4FG's already-sharp display.

All the FGs sport flat-square displays, which, while not flat panels like Sony's Trinitron tube, present realistic images and text with little distortion. The micro-processor control panels on the FGs let you easily size and position the display area and save your settings in memory. NEC's unique integrated color-calibration system (on all but the 3FGx) allows you to match screen colors to those of your printer or service-bureau output. Each FG complies with Sweden's MPRII ELF and VLF emissions standards, according to NEC.

Testing the 4FG

I tested the 15-inch 4FG, whose price and sharp display promise to make this model the most popular in the FG line for Windows- and Macintosh-based business applications. The 4FG offers the standard check-off items for business monitors. It has a 0.28-mm dot pitch, and it supports VGA, Super VGA, 8514/A, noninterlaced 1024- by 768-pixel display, and XGA modes. With the optional \$20 interface adapter, the 4FG supports Mac II and LC users.

The 4FG's maximum resolution of 1024 by 768 pixels will serve most business users today, but given the rapid introductions of higher-resolution and rela-

tively low-cost graphics cards that run at 1280 by 1024 pixels, the 4FG could soon run out of headroom. Those who require the higher resolution must look to the larger 5FG or 6FG and their substantial increase in price.

When displaying its maximum resolution, the 4FG supports either 60 Hz or 70 Hz in noninterlaced mode. The monitor supports 72 Hz when running 1024 by 768 pixels in interlaced mode or 800 by 600 pixels and VGA resolutions.

The front-panel controls are in easy reach and make it a breeze to resize and position the display. Included in the panel is a degauss button that you press to clear stray magnetic fields. When you switch to color mode, the same controls let you adjust the display colors to add or subtract percentages of red, green, and blue. You can select and save into memory up to three color-level combinations to match specific color models or service-bureau output. A sync switch on the panel lets you select the monitor for use with PCs or Macs.

The 4FG presents a bright, high-contrast display (thanks in part to an Invar shadow mask) that I found easy to read even after hours of editing manuscripts. The 15-inch display was large enough to work comfortably in Windows. I noticed no flicker even when I ran it at 1024 by 768 pixels. Windows icons, while small, remained easily discernible in the highest resolution.

I found the optional monitor lens (\$79) to be practically a necessity. The contrast that makes the display so appealing lessens considerably without the lens. Likewise, glare is a problem without the lens (background reflections existed even when the lens was in place). Overall, however, I prefer the deep black, glare and all, in the 4FG to the anti-glare, flat-black coating on a MultiSync 3D in the BYTE Lab.

NEC deserves credit for designing a bevel around the outside of the display that lets you slip the lens onto the monitor. Unlike most covers of this sort, the MultiSync lens looks like an integral part of the overall unit and not something slapped on as an afterthought.

Close examination of the screen revealed some pincushioning: waviness and bowing of vertical lines. This was most evident when a window abutted the corner of the display. The FGs provide

BYTE ACTION SUMMARY**■ WHAT THE MULTISYNC 4FG IS**

A 15-inch, flat-square display for PCs and Macintoshes.

■ LIKES

Crisp, high-contrast display; integrated color calibrator.

■ DISLIKES

Slight but noticeable wavy lines (pincushioning) when running Windows; maximum resolution of 1024 by 768 pixels.

■ RECOMMENDATIONS

For general business applications that don't require higher than 1024-by 768-pixel resolution, the 4FG is a solid choice for displaying crisp colors and text.

■ PRICE

\$1028 as tested with optional (\$79) monitor lens

Circle 1222 on Inquiry Card.

adjustments within the color-calibration mode to increase or decrease pincushioning, and I found these controls to be generally effective. However, the outside edges of the Windows screens remained wavy to some degree no matter how much I adjusted the controls. In practice, though, this distortion didn't affect my work. In addition, the light background of Windows helped reveal a hot spot in the center of the display: The middle of the screen was noticeably brighter than at the edges.

I evaluated the MultiSync 4FG with the optional lens using Sonera's DisplayMate software, which provides a series of test screens to determine display quality. For comparison, I ran the same tests on an NEC MultiSync 3D, a 14-inch display, and Sony's new CPD-1604S, a 16-inch Trinitron monitor priced at \$1700 (for a complete review of the CPD-1604S and dozens of other high-resolution monitors, see the BYTE Lab Product Report on monitors coming in May). My test platform consisted of a Tangent 320s 20-MHz 386SX with ATI Technologies' Graphics Ultra graphics board (a 1-MB video RAM accelerator that runs ATI's Mach 8 coprocessor, an 8514/A clone).

The DisplayMate test screens highlighted some of the flaws I noticed when working with the monitor. But overall, the display proved to have accurate

screen uniformity and almost no geometric distortion, and it was on target with color registers. I noticed no ghosting and only slight persistence with the monitor. It passed DisplayMate's pincushioning test, probably because the test screen background is black and the test lines are white. As I've mentioned, when the display is pushed harder to reproduce black lines on a white background, distortion crops up.

I note all this for the record, but my overall satisfaction with the 4FG is high, especially considering its \$949 price. The Sony CPD-1604S didn't exhibit wavy pincushion lines, and its crisp display breezed through the DisplayMate tests. But for the money, the 4FG is an impressive monitor. It offers a nice compromise for those who want better performance and a larger display than 14-inch monitors but balk at the prices of the finest 16-inch and larger monitors. As I've noted, the maximum resolution of 1024 by 768 pixels is part of that compromise.

If you're a GUI-centric business user looking to enjoy what today's multiscanning monitors have to offer, the MultiSync 4FG is a sound choice. ■

Gain speed in your problem solving and confidence in your answers with Maple V...

3-D Tube Plot created with Maple V.

The symbolic math software for engineering, science, and education professionals.

Maple, developed at the University of Waterloo, is today's most complete symbolic math package, and it's now available from MathSoft, the makers of Mathcad. Maple's comprehensive library of over 2,000 built-in functions and easy-to-use interactive environment delivers a maximum strength program in a surprisingly uncomplicated package.

• **Provides power and flexibility.**

You won't believe that something so powerful runs on everything from supercomputers to computers with as little as 1MB of memory. And Maple's flexibility makes it easy to share files across all platforms. It's completely programmable... and Maple's user interface supports natural mathematical calculations, so you can request an infinite variety of computations and graph your output in two or three dimensions.

• **Use for a wide range of applications.**

Maple is ideal for a wide range of applications, including helicopter blade design, VLSI design, chemistry, satellite guidance systems, econometrics, electrical engineering, and applied mathematics — to name just a few. Maple frees you from the "bookkeeping" of complex calculations and lets you concentrate on modeling and problem solving.

486-B²T

486/860 Speed... Microway Quality.

Microway has engineered four distinctive black tower systems. The **486-B²T** is designed for high-end users. It comes standard with American 486 motherboards and power supplies, yet has a reasonable starting price of \$2,195. A broad range of options can be installed including high speed and capacity hard disks, intelligent serial controllers, tape back-up units, high end graphics adapters and our *Number Smasher-860*. These systems are ideal for configuring Novell or UNIX file servers, multiuser systems, and workstations for graphics, CAD and scientific uses. The **486-B²T** comes with dual fans, *Across the Board*™ Cooling and American industrial grade power supplies. All systems are thoroughly tested, burned in and include the best technical support in the industry, which we've provided since 1982.

Number Smasher-860

The key to attaining workstation performance is Microway's 40MHz *Number Smasher-860*. It features a four-way interleaved 64-bit memory system that runs at 160 megabytes/sec. The *Number Smasher's* i860 has been clocked at 80 megaflops doing matrix multiplies, 67 megaflops doing FFTs and 11.8 Double Precision Linpack Megaflops on large arrays—ten times the speed of a 486 and twice the speed of a Cray 1F! One happy user recently reported that his "Baby Cray" was happily humming away saving him thousands of dollars per month in 3090 rentals. The *Number Smasher* comes with the finest i860 compilers on the market, your choice of Microway's NDP™ FORTRAN, C/C++ or Pascal.

Call or write today for more information on Microway's new black tower systems.

HARDWARE AND SOFTWARE

Video Goes Digital with Fluency

TOM YAGER

Many of us who track the rapid growth of multimedia technology share a common view of the future: Video will enjoy widespread use as a data type. This will stem partly from the undeniable appeal of viewing moving video on your computer's display. But the practical benefits of tagging E-mail, database records, and documents with video clips far outweigh the "gee-whiz" value.

To bolster this view, a new generation of multimedia technology is emerging out of earlier, more primitive attempts at turning moving video into digital data files. With Fluency, Fluent Machines is among the first companies to package one of these new digital-video technologies for broad use. Fluency is a combination of PC hardware and software that lets you capture moving video images in real time and store them in files on your hard drive. You can play back that video with perfectly synchronized audio in a window on your PC's monitor.

Most significant is FluentStreams, the software component that enables developers to easily build digital video into applications. For nondevelopers, Fluency offers a glimpse of how digital video can be integrated into general desktop applications.

Most of Fluent Machines' work in digital video focuses on software and standards, but since no other company was shipping digital-video hardware late in 1991, Fluent Machines created the VSA-1000. This first-pass hardware was constructed to give eager developers a jump on creating digital-video applications.

The VSA-1000 has some pretty impressive specifications: real-time capture and playback of moving video and synchronized audio at a variety of bit rates (ranging roughly from 384 Kbps to 2 Mbps); image compression through an on-board C-Cube JPEG chip; the ability to simultaneously display live incoming video and captured video playback in separate windows; digital "zooming" of live and captured video (up to 300 percent); and pass-through of a standard VGA signal.

Since the VSA-1000 is planned for obsolescence, I won't dwell on its short-

Fluency's VideoPad application records, plays, and edits video clips. Programmers can use FluentStreams library functions to build digital video into their own programs.

comings. It does, however, illustrate that digital video has some way to go before everyone will want it. The minimum requirements for a Fluency host system are 8 MB of memory, a 25-MHz 386, and three empty slots. One of the VSA-1000 boards has a daughtercard that juts out far enough to obscure the neighboring slot. No matter how you slice it, you're talking about a big system. The new boards in development are reportedly trimmer, less demanding, and much easier to install.

Future hardware likely to be supported by FluentStreams includes other JPEG boards, and these are likely to behave much like the VSA-1000. Other standards, like MPEG and Intel ActionMedia II, use compression schemes that preclude certain capabilities (like quick random access). So while FluentStreams will adjust to any digital video hardware, its capabilities are inevitably tied to those of the hardware being used.

Down by the Video Stream

I installed the Fluency hardware and software in a Tandy 4033 LX Multimedia, a 33-MHz 386 system with MPC-compatible CD-ROM and audio gear. I connected the video and audio outputs from an NEC PC-VCR (a computer-controllable Super VHS VCR) to the VSA-1000's input jacks.

The real heart of Fluency is FluentStreams. This is a scheme for manipulating digital-video hardware and video and audio files, and a foundation for digital-video applications. It is hardware-inde-

pendent, so it will adapt to whatever hardware becomes popular. Several vendors have already agreed to make FluentStreams part of their digital-video solutions. The software is also geared to work with playback-only systems. Inexpensive full-motion video playback hardware is expected to hit the streets soon from a variety of sources.

FluentStreams will also adapt itself well to the coming software-only playback (digital-video playback without hardware assistance) and the transmission and storage of video clips through networks. Developers who write to FluentStreams may have the best chance of having their applications run on these, and other, future systems.

For the developer, FluentStreams takes the shape of a digital-video application programming interface that offers precise control over capture and playback, live video (video-in-a-window), and digitized audio. FluentStreams supports not only playback of digital-video clips, but editing of them as well. The FluentStreams API is based on the concept of Digital Video Objects—windows in Microsoft Windows that understand how to deal with video and audio. As far as Windows programs are concerned, DVOs are full-fledged windows; they can be manipulated using regular Windows calls and referenced through ordinary window handles.

FluentStreams defines three flavors of DVOs that cover what most digital-video applications might need: an analog input object that displays external (live) video

in a scalable window with audio pass-through; an audio stream object that can record and play digitized audio files; and an audio/video stream object that manipulates digitized audio and video. You can work with DVOs at a simple level. Playing back an audio/video stream involves four DVO calls: `DvoCreateAudioVideo`, `DvoShow`, `DvoLoad`, and `DvoPlayForward`. This simple sequence creates the DVO audio/video object, shows the window associated with it, loads a stream from disk, and plays it. Even the `DvoLoad` call is optional, since the stream filename can be specified with the `DvoCreateAudioVideo` call.

Making the Cut

Once you open a video/audio or video stream, you can use DVO functions to edit the stream's contents as easily as if they were text. You can select a portion of a stream, down to an individual video frame, and cut or copy it to the Windows Clipboard. You can then paste that clip to another location in the stream, where it can either replace or add to data already there. After you've applied a series of edits, you can save the finished result to a stream file.

When you mark part of a video stream for editing, or position the playback pointer, the DVO calls expect frame addresses. These represent the number of frames, at 30 frames per second, preceding the location you wish to represent. This scheme is compatible with that used by most laser disc players, and it converts easily to and from other reference methods, including SMPTE time code. As a result, applications that expect to communicate with external laser disc players and other video gear can be easily converted to work instead with DVOs.

Practically Speaking

There are two ways to put Fluency, and products like it, to work. The simplest way is to use the applications provided by the vendor. In this case, Fluent Machines includes several useful programs, the best of which is called `VideoPad` (see the screen). This Windows program can play, capture, and edit video/audio clips and offers control over most of the VSA-1000's capabilities, including capture bit rates. At every rate, `FluentStreams` keeps the audio locked to the video and keeps the motion as smooth as the level of detail will permit.

I also wrote a small custom application using the `FluentStreams` library. To save time, I wrote it in `OpenScript`, the programming language behind `Asymetrix's ToolBook`. The original program opened a live video window (using `New Media Graphics' Super Video Windows` card) and placed buttons under it that sent positioning and playback commands to my PC-VCR. Each graphical button was tied to a different scene on the tape, which the PC-VCR located by frame number. The drawback to this original application was that, even though the PC-VCR is particularly responsive, it took several seconds to shuttle the tape from scene to scene.

It took less than an hour to replace the PC-VCR and `Super Video Windows` calls with rough `FluentStreams` equivalents. I used `VideoPad` to create a single stream file that included all the taped segments. I then converted the button

code to play predefined segments in that loaded stream. After the initial overhead of opening and loading the stream file, response time proved to be significantly better than that of the original external-video version of my application.

That's not to say there weren't drawbacks, but they have nothing to do with `FluentStreams`. Most of the problems related to image quality. The original application took advantage of the PC-VCR's high-quality Super VHS output and displayed it in a large window; the video looked good even at 640 by 480 pixels. Moving to digital video, even at the highest bit rate and in a smaller window, resulted in a huge step down in image quality. While it served well for "talking heads" and other trivial subjects, it fell apart when the image included complex visuals like handwriting and detailed graphics.

Issues like these aside, writing a `FluentStreams` application using `ToolBook` proved easy enough to be enjoyable. Programming in C, or any other language that can tie into Windows dynamic link libraries, should not prove much more difficult. `Fluent Machines` has packaged so much functionality into a handful of calls that digital-video applications are a snap to create.

So Many Questions

Should you go with analog (external, videotape-based) or digital? Analog is inexpensive and universally viewable, and it delivers a very high quality image. Today's digital solution is more expensive, has lower quality, and requires specialized hardware and software (not to mention lots of storage), but it offers near-immediate access and very precise control.

Is it difficult to build digital video into applications? The answer, thanks to `Fluent Machines`, is a boisterous *no*. The company's dealings with others venturing into the digital-video realm make `FluentStreams` a name to watch. As digital video, which is still in its infancy, grows to take on better image quality and storage efficiency, I expect `FluentStreams` to keep pace. So even though digital video has a long way to go before it's ready for the average desktop, you can start building today the video-capable applications that users will want tomorrow. ■

Tom Yager is a technical editor and director of the BYTE Multimedia Lab. You can contact him on BIX as "tyager" or through the Internet at tyager@bytepb.byte.com.

BYTE ACTION SUMMARY

■ WHAT FLUENCY IS

A developer's kit consisting of the VSA-1000 digital-video capture and playback boards, `FluentStreams/Digital Video Object` programming libraries, and a handful of applications.

■ LIKES

Very well designed programming interface that includes precise video editing; consideration (through varying bit rates) for storage types covering the range from hard drives to CD-ROMs and networks.

■ DISLIKES

Same as with all digital video: diminished image quality (compared to videotape or laser disc); extreme system and storage requirements.

■ RECOMMENDATIONS

Developers intending to market digital-video applications should consider writing to `FluentStreams`; the `Fluency` package will give you everything you need to get started.

■ PRICE

VSA-1000, \$3995
`FluentStreams`, \$495

SYSTEM

Local Bus Fuels PowerMate's Graphics Response

STEVE APIKI

Even the simplest application you'll find on a software dealer's shelf today will likely sport a GUI. Graphics make software more attractive and easier to use. Unfortunately, interactive graphics can also demand enough resources to choke otherwise capable systems. As applications have grown more graphical, they've required faster, more expensive systems to supply minimum acceptable performance.

The NEC PowerMate series marries high-performance graphics with mid-range systems to create highly usable, general-purpose graphics machines. The PowerMate 386/33i is an excellent example of this design philosophy. Its graphics performance is solid, and screen updates in Windows and other graphics applications are snappy. This system *feels* faster than it really is. High-speed graphics hardware shortens response time enough to make the PowerMate, with modest processing power and a modest price, seem like a real screamer.

Graphic Improvement

The PowerMate's graphics system is a local-bus video design. In this arrangement, the video subsystem is not hooked to the standard peripheral (ISA) bus; instead, it's wired directly to the CPU bus, which it shares with cache memory and the cache controller. When the CPU reads or writes video memory, it does so on the 33-MHz clock of the processor bus, not on the 8-MHz cycles of the ISA bus. Obviously, this greatly enhances video performance. NEC claims that the PowerMate can save up to an additional 200 nanoseconds per video access by avoiding the synchronizing delays imposed by the ISA bus.

Local-bus technology has been the focus of industry attention of late, with the Video Electronics Standards Association recently recommending a local-bus standard and several manufacturers developing local-bus architectures. But NEC takes a proprietary approach to local-bus technology in the PowerMate, preferring to hard-wire video to the CPU bus and tweak for performance rather than design for expandability and third-party upgrades.

High-quality, high-speed graphics is the hallmark of the PowerMate 386/33i, shown here with an optional NEC 4FG monitor.

ACTION SUMMARY

■ WHAT THE NEC POWERMATE 386/33i IS

The PowerMate 386/33i is the first Intel-based system to take advantage of local-bus video processing.

■ LIKES

Video performance is outstanding. When coupled with a MultiSync 4FG monitor, the 386/33i also provides excellent image quality.

■ DISLIKES

The PowerMate 386/33i's underpowered processing system makes it only an average performer overall.

■ RECOMMENDATIONS

The PowerMate 386/33i is best for image-intensive applications, but aggressive pricing also makes it a good choice for general Windows or DOS use.

■ PRICE

\$4208 (as tested)

| Compaq Deskpro 386/33L | 0.32 | 14724.3 |

environments, DOS 5.0 and Windows 3.0. We test six application categories for each environment, running test scripts using the following programs: Word Processing: WordPerfect 5.0 and Lotus Ami Pro 2.0; Spreadsheet: Lotus 1-2-3 release 3.1+ and Microsoft Excel 3.0a; Database: Software Publishing Superbase 4 1.3 and Ashton-Tate dBase IV; Development: Borland Turbo Pascal for Windows and Microsoft C 6.0; Scientific/Engineering: MathSoft MathCAD for Windows 3.0, MathWorks MatLab 3.5k, and Computing Resource Center Biturbo Stata 2.1; CAD: Autodesk AutoCAD release 11; and Desktop Publishing: Aldus PageMaker 4.0. The data files and test scripts are available from BYTE.

Our Unix tests show relative performance for double-precision arithmetic, the Dhrystone 2 benchmark, spawning a process (execI()), file copy throughput (in 5 seconds), pipe-based context switching, and running a shell script with eight concurrent scripts running. Unix benchmarks are available on Usenet, from Demolink, in the listings area on BIX, or on disk.

BYTE's low-level video benchmarks (see the figure) illustrate the speed of the PowerMate 386/33i's local bus. These benchmarks are not measurements of raw memory-access speed; they also include BIOS operations and times for calculating pixel placement. The PowerMate 386/33i proved about 25 percent

faster than a Compaq Deskpro 386/33L on these tests, which is a good representation of the real graphics performance improvement you can expect.

But while graphics performance was excellent, the PowerMate turned in only average numbers overall, performing at about the level of the Compaq Deskpro

386/33 on our DOS and Windows application tests. To be fair, our Windows benchmarks run in 16-color mode, and the PowerMate would undoubtedly have more of an advantage at 256 colors. Unix benchmarks showed that the PowerMate is a capable Unix workstation. Still, CPU tests revealed a noticeable bottleneck in

the system; the PowerMate's limited 32-KB cache made it significantly slower than the Deskpro at raw memory-access tests.

Good Looks, Too

Speed is not the PowerMate 386/33i's only graphics-system innovation. When it is paired with an NEC MultiSync FG-series monitor, the PowerMate automatically sets itself for the highest supported resolution and refresh rates. The built-in video system comes with 512 KB of RAM and supports noninterlaced, 70-Hz resolutions of up to 1024 by 768 pixels at 16 colors. You can upgrade to 1 MB of video RAM (VRAM); this gives you 256 colors at 1024 by 768 pixels and pushes the maximum 16-color resolution up to 1280 by 1024 pixels interlaced.

My review unit included 1 MB of VRAM and a MultiSync 4FG monitor. In 1024-by-768-pixel Windows, the view is just stunning. The 4FG handles 70-Hz refresh for a steady, beautifully clear and bright picture. (For a review of the 4FG, see "New MultiSyncs Prove That Flatter Is Better" on page 262.)

Take the monitor off the system, twist a clip on the back of the system unit, and the case pops off readily. It goes back on just as easily. While I don't usually get excited about well-designed cases, the PowerMate deserves recognition in this area. The drive and mounting bays snap out without tools, and motherboard-mounted components are easily accessible. Adding a coprocessor or upgrading memory (to 64 MB) is just a few minutes' work.

The PowerMate 386/33i has other nice touches: Although it is not designed as an expandable system, the PowerMate provides BIOS in flash memory so that BIOS updates can be downloaded from a floppy disk. Together with the easily disassembled case, this feature makes minor upgrades trivial. It also has headphone and microphone jacks, and Windows comes preinstalled on the system.

Its advanced video features, however, are what set it apart. Supercharged video and a \$3249 price (\$4208 with the 4FG monitor and 1-MB video upgrade) make this system an excellent choice for Windows or any application where interactive graphics is important. As more and more applications join that category, the PowerMate 386/33i and systems like it become even better selections. ■

BYTE

NCR 3447 Serves Up Unix

The February Solutions Focus compared high-performance file servers from Compaq, Advanced Logic Research, Tricord, Tangent, and Dell. Each included a built-in drive array for very high disk throughput and increased immunity to data loss.

Just after that review was completed, NCR delivered its own built-in drive array. We tested it in NCR's 3447 work-group server, a 50-MHz 486-based Micro Channel system. Although the 3447 can support up to four 486 processors, we tested it in a single-processor configuration with a 128-KB second-level cache. Our test system also included 16 MB of RAM, an NCR Micro Channel Ethernet adapter, a SCSI controller, and a VGA graphics system. With the 2.1-gigabyte array bundled in (which accounts for \$27,500 of the price), this super server sells for \$45,085.

NCR's drive array is a RAID (redundant arrays of inexpensive disks) level 5 system that can be set up for highest performance or to provide redundancy for data protection (for an explanation of RAID, see "File Servers Face Off," February BYTE). The array that we tested consisted of five 670-MB Seagate SCSI drives configured for RAID level 0 (striping only). We ran our tests under NCR's Unix System V release 4.

The table shows the results of BYTE's Unix network server tests for NCR's 3447, Compaq's Systempro, and Tangent's Multi-Server. When comparing results, keep in mind that the Compaq and Tangent systems are 33-MHz 486-based machines, which we tested with arrays of four, not five, drives.

The 3447's random I/O performance was outstanding. On sequential tests, where fast processor performance matters less than drive controller throughput, the 3447 performed only at the same level as Tangent's fast Multi-Server. But for the majority of operations, this first 50-MHz 486 server we've tested earns the title of fastest server we've seen.

| BYTE UNIX NETWORK BENCHMARK RESULTS | | | |
|--|---------------------|-------------------------|----------|
| <i>NCR's 3447 outruns some of the fastest competitors available.</i> | | | |
| | Compaq Systempro | Tangent Multi-Server | NCR 3447 |
| Random I/O with transmissions (Kbps) | | | |
| One node | 284 | 335 | 476 |
| Three nodes | 140 | 173 | 313 |
| Six nodes | 61 | 95 | 198 |
| Sequential I/O with transmissions (Kbps) | | | |
| One node | 226 | 240 | 249 |
| Three nodes | 86 | 124 | 116 |
| Six nodes | 42 | 61 | 55 |

NCR's 3447 50-MHz processor and high-speed drive array place it among the fastest Unix file servers we've tested to date.

Connect Printers Without Wires

Although it debuted in North America at 1991's Spring Comdex, Infralink, by the company of the same name, didn't receive FCC Class B approval until late last year. Now ready for prime time, Infralink generally delivers on its promise of quick and wireless connections among PCs and printers.

Infralinks use the parallel port to connect to PCs and printers. When you send a print command, the two devices pass the file using infrared light, broadcasted rather than sent as a direct beam. This, in theory, reduces problems associated with line-of-sight obstructions. According to the company, up to eight PCs and printers as far as 230 feet apart can communicate using Infralink.

The company claims that at distances of up to 23 feet, Infralink will work without any special orientation of the modules. Our tests bore this out: At roughly 20 feet we could establish almost instantaneous connections, although we sometimes had to twist the receiving

module around in the air. At 40 feet, across four rows of cubicles, we were never able to successfully send a print message. Infralink says that at that distance, the sending modules should be wall mounted and angled in the direction of the receiving unit.

For those who can't bear the cost and effort of rewiring connections, Infralink is a possible alternative. However, each module costs \$320. So the minimum price of \$640 to get one printer and one PC talking would make us explore some more conventional print sharer avenues before we took the plunge into wireless communications. ■

Reviewer's Notebook provides new information—including version updates, new test data, long-term usage reports, and reader feedback—on products and product categories.

CSS:STATISTICA

CSS/3™ Complete Statistical System with over 1,000 presentation-quality graphs fully integrated with all procedures and on-screen graph customization ■ The largest selection of statistics in a single system; in-depth, comprehensive implementations of: *Exploratory techniques; multi-way tables with banners; nonparametrics; distribution fitting; multiple regression; general nonlinear estimation; logit/probit analysis; general ANCOVA/MANCOVA; stepwise discriminant analysis; log-linear analysis; factor analysis; cluster analysis; multidimensional scaling; canonical correlation; item analysis/reliability; survival analysis; time series modeling; forecasting; lags analysis; quality control; process analysis; experimental design (with Taguchi);* and much more ■ Manuals with comprehensive introductions to each procedure and examples ■ Integrated Stats Advisor expert system ■ Extensive data management facilities (powerful spreadsheet with formulas; relational merge; data verification; flexible programming language) ■ Optimized (plain English menus/mouse) user interface: even complex analyses require just few self-explanatory selections (CSS can be run without manual; Quick Start booklet explains all basic conventions) ■ Macros, batch/commands also supported ■ All output displayed in Scrollsheets™ (dynamic tables with pop-up windows and instant graphs) ■ Extremely large analysis designs (e.g., correlation matrices up to 32,000x32,000) ■ Unlimited size of files; extended precision; unmatched speed (Assembler, C) ■ Exchanges data (and graphics) with many applications (incl. Excel®, Lotus 3®, dBase IV®, SPSS®) ■ Highest resolution output on practically all printers (incl. HP, Postscript), plotters, recorders, typesetters ■ IBM compatibles, 640k or more ■ Price: **\$595.**

Quick CSS™ Subset of CSS/3: all basic statistical modules (incl. data management) and the full, presentation-quality graphics capabilities of CSS/3 ■ Price: **\$295.**

CSS:GRAPHICS™ A comprehensive graphics/charting system with data management ■ All graphics capabilities of CSS/3 and, in addition, extended on-screen drawing, 19 scalable fonts, special effects, icons, maps, multi-graphics management ■ Hundreds of types of graphs ■ Interactive rotation and interactive cross-sections of 3D graphs ■ Extensive selection of tools for graphical exploration of data; fitting; smoothing; spectral planes; overlaying; layered compressions; marked subsets ■ Unique multivariate (e.g., 4D) graphs ■ Facilities to custom-design new graphs and add them permanently to menu ■ Import/export of graphs and data, 15 formats ■ Optimized (menu/mouse) user interface; even complex graphs require few keystrokes: all graphs on this page can be produced from raw data in less than 20 minutes ■ Macros, batch/commands also supported ■ Unlimited size of files ■ Highest resolution output on all hardware (see CSS/3) ■ IBM compatibles, 640k or more ■ CSS:GRAPHICS is included in CSS:STATISTICA (available separately for **\$495**).

Megafile Manager™ Comprehensive analytic data base management system ■ Unlimited size of files (up to 32,000 fields or 8 MB per record) ■ Megafile Manager is included in CSS/3 and CSS:STATISTICA (separately: **\$295**).

CSS:STATISTICA™ A fully integrated system that combines all the capabilities of CSS/3 and CSS:GRAPHICS into a single extremely comprehensive data analysis system ■ Price: **\$795.**

Domestic sh/h \$7 per product; 14-day money back guarantee.

Rappôt The Unix/DOS Bridge by Tundra Software

Unlike terminal emulators, Rappôt puts your PC in direct menu-driven contact with a Unix host, without asking you to remember a thing. All function and cursor keys work exactly as you would expect. And, if you wish to transfer a file, simply press Alt-Spacebar. Rappôt displays both the DOS and Unix directories. Then use Rappôt to navigate directories, highlight the file you want, and press enter.

SpeedEdit

by Bradford Business Systems

SpeedEdit is a professional level text editor available for Windows 3.0, X-Windows Motif, & X-Windows OpenLook as a true Windows application. Also available are DOS, OS/2, SunOS, SCO Unix & Xenix, Interactive Unix, ATT Unix, HP-UX, MPE & MPE-XL character versions. Includes user customization; DDE; regular expressions; language sensitivity; keyboard macros; multiple file access; compilation & testing from within. Call for Unix, MPE & multi-user pricing.

LIST: \$295 **PS Price: \$265**

MachTEN

by Tenon Intersystems

A Smaller, Simpler UNIX! MachTEN turns your Macintosh into a fully featured Berkeley 4.3BSD Unix workstation. MachTEN includes the full TCP suite of protocols, NFS, UUCP, and r-series. Unix multi-tasking lets you run multiple Macintosh applications along with multiple Unix applications. All with the friendly Macintosh "point & click" interface. Built on a Carnegie Mellon Mach foundation. Turns every Macintosh into an open system. Macintosh Classic thru MacIIx; 4MB; 40MB disk.

dBFast for Windows

by
Computer
Associates

dBFast provides a migration path to Windows for dBASE, Clipper and FoxBase

applications. With extensive

Windows support applications, you can utilize Windows objects such as push buttons and check boxes. Graphical images can be stored in the data-base for use with visual applications such as personnel databases. A single user version of dBFast meets the needs of the individual, while a multi-user version provides the data sharing capabilities required by information groups and corporate work groups. Support for Novell, LANManager, Token Ring and other NetBIOS compatible systems is available. Full support for Dynamic Link Libraries (DLL) and Dynamic Data Exchange (DDE) provide integration with other Windows applications and support for external routines, such as C programs. Computer Associates is proud to deliver a complete dBASE compatible development environment under Windows.

▶ FrameMaker

The richest blend in document publishing.

▼ *FrameMaker 3.0 with conditional text running on a Macintosh.*

◀ *FrameMaker 3.0 running under the XWindow system on SCO Open Desktop on a 386/486 PC.*

▶ *FrameMaker 3.0 under the NeXTStep interface on this NeXTstation Color.*

▲ *FrameMaker 3.0 on a SPARCstation under Sun's OPEN LOOK interface.*

Frame Technology® has a unique formula for publishing everything from simple memos to long, structured documents: FrameMaker®.

▶ FrameMaker blends into one integrated, easy-to-use program all the essentials of publishing: Authoring, editing, graphics, page layout, and production. Even math equations and hypertext.

▶ And FrameMaker 3.0 blends in new robust and exclusive features. Like conditional text capabilities to help you generate and maintain multiple versions of a single document. And an integrated, multipage table editor.

▶ FrameMaker is the perfect complement to all your hardware, because it runs on more platforms than any

other publishing program. Including Apollo, Macintosh®, DEC, HP, IBM, NeXT, Sun, 386- or 486-PCs running SCO Open Desktop, and a host of other UNIX platforms—with complete file compatibility. So your workgroups not only share files, but also their skills and expertise.

▶ For a taste of FrameMaker 3.0, call 1-800-U4-FRAME Ext. 987 for more information and the name of your nearest reseller. And start brewing your own blend of publishing.

MAC PROGRAMMING REVEALED

The BYTE Lab showed all the telltale signs of a typical late-night programming project. A pyramid of Diet Coke cans had been erected on the lab bench next to the environmental test chamber. The floor was littered with marked-up laser-printed listings and a medley of candy bar wrappers, while a CD player blasted out licks from a Donna Summer disco album. None of these details mattered at the moment. What did matter was the behavior of the sleeping PowerBook 140, sitting under the waiting servos of Thumper II, BYTE's battery-life testing mechanism for notebook computers.

Two bleary-eyed people stared at the testing apparatus: me and Howard Eglowstein, BYTE Lab testing editor and Thumper's creator. Howard had used Thumper to run battery-life tests on the platoon of PC notebooks arranged in neat formation on an adjacent lab bench. I was there to implement the Macintosh version of the support code that had to run on the PowerBooks during their tests. This support code periodically writes to the hard disk to simulate user operations and transmits status reports to Thumper's host computer via a serial cable.

I had started the project on the preceding afternoon and completed the code during the wee hours of the night, but there was still the question of whether the program could function reliably for the many hours the test would run. So far, 5 hours had passed without a glitch. On schedule, a servo whirled, and a rod tapped the notebook's Return key. With an understated pop, the Power-

Book's screen came to life, its hard disk hummed, and a message appeared on the host PC's screen. We both breathed a sign of relief.

Somebody wandered in, and, spotting the debris, asked what was going on. I explained that the Mac notebook battery-life tests were under way. When asked how difficult it had been to write the Mac code, my explanation was, "With the exception of some problems with the serial port, it was just a matter of cutting and pasting old stuff into the shape of a battery-check program."

Sound absurd? Admittedly, I wasn't writing a complex application like Wingz, but a lot of Mac programming is like that. To a novice Mac programmer, that raises the question, "Where does old stuff come from?" The old stuff comes from the bits and pieces of code you cobbled together trying to get the Mac to do something—anything—in the first place. These first fumbling steps are the hardest, because there's a lot you have to understand about the Mac environment before you can write a line of code. But it's not impossible, especially if you place limits on what the program should accomplish while you gain an understanding of the computer. What I'll try to do here is show you working code fragments that explain some Mac fundamentals and give you something to start out with in your own programming attempts. But I'll

**Programming the
Macintosh is not as
difficult as rumor has it.
Here's how.**

Listing 1: A Mac application that writes "Hello world" in a window.

```

/* Hello world example */
#include <Types.h>
#include <QuickDraw.h>
#include <Windows.h>
#include <Fonts.h>
#include <Memory.h>
#include <Menus.h>
#include <Dialogs.h>
#include <Events.h>
#include <OSEvents.h>
#include <THINK.h>

#define NIL          0L
#define IN_FRONT    -1
#define IS_VISIBLE   true /* Window will be visible when drawn
                           (for debug) */
#define NO_GOAWAY    false /* Window lacks a go-away box */
#define STACK_SIZE  20000

void main()
{
    WindowPtr  thisWindow;
    Rect        windowRect = {40, 40, 60, 120};

    /* Set up application's heap and stack */
    SetApplLimit(((Ptr) ApplZone() + STACK_SIZE));
    MaxApplZone();

    /* Make sure we've got some master pointers */
    MoreMasters();
    MoreMasters();
    MoreMasters();

    /* Set up the Mac */
    InitGraf(&qd.thePort);
    InitFonts();
    FlushEvents(everyEvent, 0);
    InitWindows();
    InitMenus();
    TEInit();
    InitDialogs(0L);

    /* Make our window */
    if ((thisWindow = NewWindow(NIL, &windowRect, "\pHello", IS_VISIBLE,
                               noGrowDocProc, (WindowPtr) IN_FRONT, NO_GOAWAY, NIL)) != NIL)
    {
        SetPort(thisWindow);
        MoveTo(5, 10);
        DrawString("\pHello world");
        InitCursor();
        do
        {
            /* Get rid of wristwatch cursor */
            /* Sit in a tight loop... */
        }
        while (!Button()); /* ...until mouse is clicked */
        DisposeWindow(thisWindow); /* Discard storage for window object */
    } /* end if thisWindow != NIL */
    else
        SysBeep(30);
} /* end main() */

```

start by dispelling some common Mac misconceptions.

A Change of Interface

Rumors have always run rampant that the Mac is hard to program and that it takes hundreds of lines of code to write out the message "Hello world." Interestingly, as Windows 3.0 becomes more popular, the same grumbling can be heard about it as well.

The first myth—that it's hard to program—came about because the Mac, in making things easy for the end user, makes more demands on the programmer. This is because the Mac (and Windows) has an event-driven GUI. The user interacts with the computer by creating events—mouse-clicks, menu selections, and key presses—that the application must respond to. That complicates things for the programmer, who has to anticipate all sorts of user

actions at any time. It's not like in DOS or command-line interface-based Unix applications, where you steer users by prompting them for information in a specific order.

To manage this event-driven interface, the programmer implements an *event loop*, which is a chunk of code that polls for events and dispatches them to the appropriate handler code. As you might expect, for sophisticated applications, the event loop and its handler code can be very large, since the loop must field a variety of events and provide reasonable default settings if the user doesn't happen to give them. This also happens to fuel the second myth—those hundreds of lines of code I mentioned earlier.

If you were to implement a full-blown event-driven interface for a "Hello world" application, then this myth would become reality. But look at the matter practically, where you just generate the message itself. Listing 1 is a complete Mac application, written in Symantec's Think C 5.0, that places "Hello world" in a window. As you can see, you only have to write 48 lines of actual C code (excluding comments) to accomplish this. Obviously, the header files supply numerous "hidden" lines of definition code (for a total of 5345 lines, according to the compiler), but that's not the point: You only had to write 48 lines.

By itself, this example doesn't do much: It lacks that event loop I've been talking about. The example shown in all the C primers doesn't do much, either. However, both serve as a starting point for programming basics. Listing 1 illustrates the fundamental operations required to initialize the Mac's graphical environment, open a window, wait for a user action, and then quit cleanly. The Mac's firmware routines, called the *Mac Toolbox*, are used extensively even in this simple program.

Looking more closely, you can see that the Hello application first divvies up the memory partition given to it by the Process Manager (System 7.0) or MultiFinder (System 6.0.x), using the Toolbox call `SetApplLimit()`. This adjusts the application's heap (program area) size, which in turn gives more or less of the memory partition to the application's stack. The default stack size is 8 KB (it varies according to the type of Mac hardware and the Mac OS version number). This size is normally adequate, especially for my example. However, I put the `SetApplLimit()` call there, because if you make heavy use of recursive functions that eat up the stack, you'll want to be aware of it.

Next, you initialize the various Mac Managers. (A Manager is a collection of related Toolbox functions. For example,

ARCHITECTURE MAKES THE DIFFERENCE

Screen 1: Using ResEdit to create a dialog box that displays four values. The digits 0 through 3 will be replaced with value strings at run time. Both the DLOG and DITL resources have an ID of 400.

Screen 2: The dialog box used to obtain a choice from the user. A mouse-click on either button supplies an item value to the program. All other events are ignored. Note that this dialog box isn't initially visible; the code displays it later.

Listing 2: A diagnostic function that displays the contents of four suspect variables in a dialog box. Note that the ID number (400) used by GetNewDialog() matches the DLOG resource ID built in screen 1.

```
#include <Types.h>
#include <QuickDraw.h>
#include <Windows.h>
#include <Dialogs.h>

#define DIAGNOSTIC_DIALOG 400
#define NIL 0L
#define IN_FRONT -1

void Report_It(long var1, long var2, long var3, long var4)
{
    unsigned char item1Str[10], item2Str[10], item3Str[10], item4Str[10];
    short item;
    GrafPtr oldPort;
    DialogPtr timeDialog;

    NumToString(var1, item1Str);
    NumToString(var2, item2Str);
    NumToString(var3, item3Str);
    NumToString(var4, item4Str);
    ParamText(item1Str, item2Str, item3Str, item4Str);
    timeDialog = GetNewDialog(DIAGNOSTIC_DIALOG, NIL, (WindowPtr)IN_FRONT);
    GetPort(&oldPort);
    SetPort(timeDialog);
    DrawDialog(timeDialog);
    ModalDialog(NIL, &item);
    SetPort(oldPort);
    DisposDialog(timeDialog);
} /* end Report_It() */
```

the Window Manager deals with the manipulation of windows on the screen.) Then you create a window in which to place your message, using the Window Manager call NewWindow(). The important thing to note here is the error-checking performed in case the NewWindow() call fails: You beep and abort the operation. Next, you tell the Mac OS to make your window the active graphics port using SetPort(). (If you don't do this, you may write your message to the Desktop or another window and thus damage the windowing environment.) Finally, you

write the string "Hello world" to the window and then hang around waiting for a mouse-click using Button(). When you get one, you clean up after yourself and exit.

The linear execution thread of this sample program is identical to that of a DOS or Unix program. Having praised the event-driven design, now I will say something heretical: There's nothing wrong with doing things this way on the Mac. This linear sequence eliminates a lot of messy details while you are learning how the various Managers operate. It's also ideal in cer-

tain situations, such as implementing a quick problem-solving hack. I've written a few utilities this way because I only needed to elicit one or two responses from a user to accomplish a task, as you'll see later. If you ever want to write a commercial product (or a great utility), however, you'll need to implement a complete event loop to provide a flexible and friendly interface for the user. For now, I'll stick with the keep-it-simple approach.

Get the Message Out—Carefully

One of the nice things about C is that if you encounter a programming problem, you can slap some strategically placed printf() statements in the code to dump the values of suspect variables to the screen. Both Think C and Apple's MPW C support the standard C libraries, so you can use console I/O functions to write to the Mac's screen, and file I/O functions to handle disk files.

You're discouraged from mixing these standard I/O functions with Toolbox calls, and for good reason. Say that you've made a window and you are having problems with the text appearing in it. In an attempt to spot problems, you use a printf() function to examine some control variables. What you're really going to see is a bomb box, because the console I/O function will attempt to initialize the Window Manager for its own use, which in turn stomps all over the graphical environment you already set up. Result: The Mac crashes and burns.

This problem applies to other I/O functions, too: If you're using the fwrite() function to write to the hard disk, then avoid using Mac File Manager calls at all costs. The trick is to prevent conflicts between what you're actually doing and what the standard I/O functions intend to do. What this means is that you want to use a careful mix of nonconflicting Mac Toolbox calls and standard I/O functions to get the job done.

ResEdit to the Rescue

Back to that troublesome window example. If you can't use printf(), then how do you examine the variable data, short of dropping into a debugger? Since you're using the Mac Toolbox already, go an extra step and use the Dialog Manager to display the values. You create a dialog box using ResEdit, Apple's resource editor. Diagnostic code that you write then converts the target variable values to strings and places these strings in the dialog box.

ResEdit is available from the Apple Programmers and Developers Association for about \$25. It is also bundled with some development software, such as Think C

**WHERE
ON EARTH
CAN YOU CALL US
FOR AS LOW
AS \$20
AN HOUR?**

Now you can connect with BIX, the on-line information service, at a fixed hourly rate from many cities around the world. Compared to packet switching networks, this saves you up to 75% depending on your location. There's

no application process. No character or packet fees. No extra charge for 2400 baud. And you're billed directly by BIX for your phone usage.

Just call the access number nearest you, log on, and the world of BIX is at your fingertips.

} /* end main */
```

5.0. ResEdit has evolved over time to the point where the latest version (2.1.1) makes creating most resources just a matter of pointing and clicking.

Start by using ResEdit to create a new resource of type DLOG and sketching out a window of the desired size. Double-clicking on this window calls up the dialog items (DITL) editor. Now you add static text boxes to display the desired variables, as shown in screen 1. The "caret digit" string in these text boxes tells the Dialog Manager to substitute a string for this position in the window. Be sure to make the OK Button dialog item 1. By default, the Dialog Manager assumes that item 1 is the OK button, which means that you can dismiss the dialog box by pressing the Return key after you've looked at the values. You'll notice that a DITL resource is automatically created when you complete the dialog box design.

Finally, save the resources in a file. For Think C, my support-code project file was named Battery Check. If you name the resource file BatteryCheck.rsrc, Think C automatically loads these resources when you test-launch the Mac program. This is very convenient when your program is still in the early stages and you might have to revise the dialog box layout. Once you've completed the resource and code design, you have the Think C compiler create a stand-alone Mac application, where it copies these resources into the application file.

Listing 2 shows the C code that implements the rest of the diagnostic function. This routine takes the four values passed to it and converts them into strings using the Toolbox call NumToString(). ParamText() then places these strings in the corresponding locations in the dialog box. That is, ParamText()'s first argument gets placed at ^0 in the dialog box, the second one is placed at ^1, and so on. Next, the code has the Dialog Manager create the dialog box (GetNewDialog()), set the graphics port, and draw the dialog box's contents. ModalDialog() looks for a mouse-click or a key press. When it receives one, it exits, the current graphics port is restored, and you clean up. While this diagnostic function isn't quite as convenient as printf(), once you get the resource and diagnostic function code working, it's very handy for debugging work.

A Two-Way Dialog

So far, so good. I've covered how to get a simple Mac application up and running, create windows, and display information using the Dialog Manager. Now, how do you get responses from the user? If you've got the hang of the Dialog Manager, this

Your interface doesn't have to be a straitjacket.

C-scape is the most flexible user interface package for text or graphics-based applications.

All too often user interface management systems force you to program with your hands tied. You do things their way or not at all.

C-scape sets you free. It provides powerful features - scrolling windows, mouse support, menus, text editors, help, data entry, etc. - yet lets you tie your own functionality to these objects without touching the underlying code.

What's more, C-scape's object-oriented architecture makes it easy to integrate with any other C library. So you aren't

locked into one solution.

Unlike many other screen managers, C-scape is a true windowing environment. Which makes it powerful enough to tackle the most

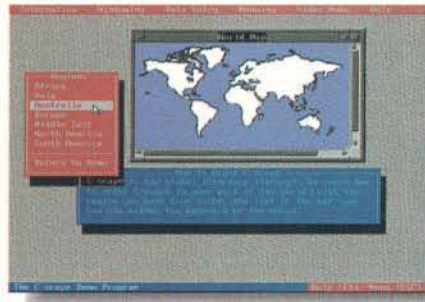

...and on character-based terminals...

demanding user interface requirements.

C-scape is also so easy to use you can affordably build elegant new interfaces even for simple applications and databases.

Prototyping and code generation are no problem. C-scape's Look & Feel interactive screen designer lets you create full featured

screens, test them, and then automatically generate complete C source code or binary screen files.

Applications built with C-scape can run on PC's...

C-scape applications port without modification across DOS, extended DOS, OS/2, UNIX, AIX, the X Window System, QNX and VMS.

And since C-scape supports text and graphics

simultaneously, it's a smart choice for users who want to add graphics to existing text applications.

See for yourself why thousands of programmers worldwide use C-scape. Call for a copy today. And escape the interface straitjacket.

Liant is the world's leading supplier of open systems programming tools, languages, and libraries. Call for your free Liant product catalogue.

...and under the X Window System.

turns out to be surprisingly easy. The key is understanding the behavior of the just-mentioned `ModalDialog()`. This call presents its namesake, a modal dialog box.

Modal dialog boxes are called such because the Mac is placed into a single mode: No other user events are allowed. If you click outside of such a dialog box, the Mac just beeps at you. You use modal dialog boxes in situations where the user *must* make a choice or supply information that the application requires before it can pro-

ceed. When you click on a button or other object in the dialog box, `ModalDialog()` returns the item number of the object that was clicked on.

This behavior has important implications that you can exploit. First, to lock out all other events, `ModalDialog()` implements a sort of mini-event loop that discards all events except those having to do with its window. Second, it returns a dialog item value that you can use in a `switch` statement to control the execu-

tion of your Mac application. By a careful arrangement of buttons, descriptive text, and item numbers for the objects in your dialog box, you can politely prompt the user as to what he or she should do, and then respond to it.

Here's a real example of putting a modal dialog box to work. A while ago, I was involved with running the Mac benchmark test suite on the Mac Quadra 900. Unfortunately, several of these applications crashed on the Quadra, due to side effects caused by the 68040 processor's caches running in the copyback mode. While Apple provides a Cache Control cdev to turn the 68040 caches off or on, you have to reboot the computer for the change to take effect. As fast as the Quadra is, I didn't want to wait for it to restart every time I had to change the operating mode of the caches—not with all the applications I had to run. Looking at a Motorola manual, I discovered instructions that would change the bits in the 68040's cache-control register, which in turn would switch the processor caches on or off.

For this either-or situation, the application design is simple. Screen 2 shows the interface I used: a dialog box with two radio buttons. Listing 3 shows the code that dealt with the interface and handled the job. After first initializing the Mac, I then created a hidden dialog box. Using Think C's in-line assembly feature, I used assembly code that examined the contents of the 68040's cache-control register. This information helps determine whether the caches are on or not, since I might have turned them off previously. The appropriate radio button—on or off—is highlighted to reflect the cache's current status. With the dialog box set up, I used `ShowWindow()` and `DrawDialog()` to make the dialog box visible and draw the dialog items.

The code then called `ModalDialog()` to look for user events. When this call returned, I passed the item value to a `switch` statement. (If the item number isn't either of the radio buttons, the value is thrown away and `ModalDialog()` is called again.) Once I hit a radio button, I executed the corresponding code in the `switch`. I used more in-line assembly code to modify the contents of the cache-control register, exit the loop, and dispose of the dialog box. To flush the 68040 caches before disabling them, I had to manually generate the `CPUSHA BC` instruction that performs this operation.

Amazingly, the code worked the first time. I could disable and enable the caches on the fly and rapidly complete the benchmark tests. I could get away with using these privileged `MOVEC` instructions be-

Some of the most enlightening articles in a magazine never make it to the table of contents.

Open to the table of contents in any publication and you can find some insightful stories. You'll also find some missing. Because the advertising isn't there.

Advertising is important. It's informative. It lets you know your options. And helps you to make decisions.

Like which car to buy. Which airline to fly. And what to serve for dinner.

So, next time you open a magazine, read it. From cover to cover.

Because what's on the back cover, may be just as important as what's on the front.

FEDERATION

cause the Mac OS normally runs in the supervisor mode on the Quadra. (It runs in user mode only when virtual memory is active, so the page-faulting mechanism can operate. In this case, I can't control the caches at all.) Not until two weeks later did I find out that by holding the Option key down while using the Cache Control cdev, you could switch the caches on and off the same way. Oh, well...

A Skeleton in the Closet

If you're wondering if the `do` loop and `ModalDialog()` and `switch` statements constitute a rudimentary event loop, you're correct. Obviously, an actual event loop is more complex than this and makes use of other Toolbox calls to capture user events, but if you've grasped the fundamental concept here, then writing a real Mac application is just a matter of filling in the details—a lot of details, to be sure, but it's a manageable task once you've mastered the basics.

Research some of these basics, such as handling menus. If you are stumped on some aspect of Mac programming, be sure to investigate the on-line services or BBSes for snippets of working Mac code. Or, if

you know a Mac programmer, ask him or her for information: More often than not, the programmer will be glad to share. Also, lay your hands on the programming texts mentioned in the bibliography.

Writing a full-blown Mac application, event loop and all, is a lengthy process. You may be interested to learn that most of the experts keep a code "skeleton" handy for ready use. This skeleton implements the event loop, menu, and basic file operations. Creating a new Mac application becomes just a matter of fleshing out the code skeleton with task-specific code.

More often than not, even the task-specific code is cut and pasted from other source code files. For example, I have a lot of code files that do useful things, such as displaying a continuous line count in a dialog box, building a hierarchical menu, or initializing a serial port. When it came time to write the battery-life support code, I hauled out a code skeleton that I've developed over the years and began cutting and pasting. Naturally, some detail work required new code. This wasn't too difficult a task, because I could focus all my efforts on writing the new code and trust the old code to take care of the rest.

As I said at the beginning of this article, Mac programming requires diligent work because there are so many details to handle, such as hundreds of Mac Toolbox calls and dozens of data structures. Nevertheless, if you start small and keep your first programming projects simple, you can eventually understand it all—or, at the very least, write a set of files that remembers the details for you. ■

The Source for open systems programming.

If you want to create applications that are portable and hardware independent, come to The Source.

Our new catalogue offers the broadest scope of high performance programming tools, libraries and industry-standard languages available for open systems.

And all it takes to get it free is a simple phone call.

True portability for your applications.

Anything created on one machine with our products can usually be transferred intact to virtually any other machine - from PCs to supercomputers.

Which makes vendor-independence, off-loading, down-sizing, and heterogeneous networked environments now all possible.

One stop shopping.

We offer the C-scape screen designer and C-library, RM/COBOL compilers and tools, the FIGARO+ high performance graphics tool kit, UNIX languages such as LPI C++ and LPI FORTRAN. And much more.

So come to The Source.

And leave yourself open for the future.

How Can Northgate® Put A Loaded 486™/33 EISA System To Work For You For Only \$4699?

Like The Easter Island Statues, Some Phenomena May Never Be Explained.

Visitors to Easter Island are awestruck by the statues that greet them. This same sense of awe is experienced by people who see how much performance Elegance™ 486/33 EISA gives them for such a low price.

Elegance 486/33 EISA lets you quickly tackle scientific analysis,

software development, 3D CAD/CAM/CAE, complex financial modeling plus database and network management. This unsurpassed power results from Northgate's phenomenal engineering that features:

- 80486/33 MHz processor
- 8MB of rapid 32-bit DRAM
- 128K SRAM cache
- 200 MB IDE hard drive
- 1.2MB 5.25" and 1.44MB 3.5" floppy drives

- Eight 32-bit EISA bus slots (six bus master, two slave)
- Vertical Power Case with room for eight external half-height devices
- 14" SVGA 1024 x 768 color monitor with high-speed video card
- Exclusive, award-winning OmniKey® keyboard
- MS-DOS® 3.3, 4.01 or 5.0
- Microsoft® Windows™ 3.0
- Microsoft Mouse
- DiagSoft™ QA Plus™ system diagnostic/performance software

Along the shores of Easter Island, isolated in the Pacific, a row of statues reveals the past of an ancient civilization shrouded in mystery. Some historians speculate that these figures were symbols of worship. Others believe they represent ancestors long deceased. Who they were and how the ancient craftsmen moved them to their positions without heavy machinery, are long-kept secrets that history books have failed to unlock.

You can also count on toll-free telephone technical support 24 hours a day, 7 days a week; a limited one-year parts/labor warranty with overnight shipment of replacement parts at our expense; and on-site hardware service from NCR® (second and third year plans available), plus a 30 day money-back guarantee.

For a truly phenomenal computing experience, order today.

Elegance 486e/33 MHz \$4699

System Architect kicks into overdrive: Today's Price/Performance CASE Leader Now Offers Schema Generation.

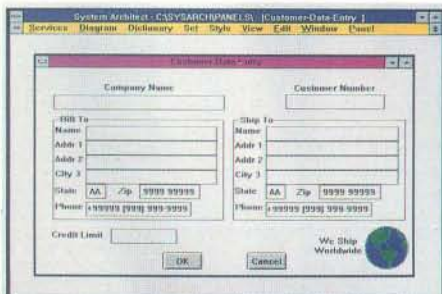

Now you can build applications even faster with System Architect's new database Schema Generator. And System Architect is so easy to use, even beginners will be productive in no time.

NEW: Schema Generator.

Translate entity models, captured in our encyclopedia, into schema for DB2, Oracle, INGRES, SQL Server, RDB, Progress, Paradox, SQL Base, AS400 (SQL), XDB, Sybase, and Informix. Generate data definitions for C or COBOL programs. And create Windows user dialogue panels.

NEW: Screen Painter. (Call for availability.)

Develop screens for Windows, Presentation Manager, or character-based applications. The screens you create are then linked to our encyclopedia.

Paint GUI screens.

Multiple Methodology Support.

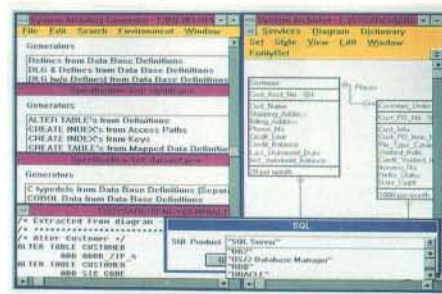

Work with such methodologies as DeMarco/Yourdon, Gane & Sarson, Ward & Mellor (real-time), Entity Relation diagrams, Decomposition diagrams, Object Oriented Design (optional), State Transition diagrams, Flow Charts and SSADM.

Integrated Data Dictionary/ Encyclopedia.

Customize your own data dictionary/encyclopedia, and get multi-user support with and without a network.

Advanced Features.

Take advantage of normalization, rules & balancing, requirements traceability, a network version, import/export capabilities, custom reporting, an extendable data dictionary, auto leveling, CRUD Matrices, and automated documentation (enhanced 2167A -- call for availability).

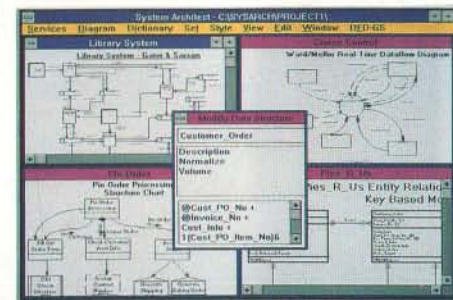

Generate schema from entity diagrams.

A Proven CASE Product.

IEEE Software Magazine called System Architect "a useful, well-planned, affordable CASE tool." CASE Trends found System Architect "to be extremely easy to use. . . with many features that are completely lacking in higher priced competitors." Toshiba said "System Architect stood out from many other prospects." And System Builder

called System Architect "truly a price/performance leader."

View data models, DFDs, and structure charts simultaneously.

Works under Windows 3 or OS/2 Presentation Manager.

You get full functionality in each environment.

Affordable.

System Architect costs from one half to one fifth the price of comparable CASE products.

WIRELESS NETWORKING

One of the most promising and widely discussed technologies of this decade is the wireless network. The idea of computers communicating through radio waves or infrared links is compelling and opens up a wide range of possible new applications for computers. Wireless networks can facilitate warehouse inventory-taking, cooperative learning in the classroom, and countless other tasks that can benefit from mobile networked computing. It's also a key enabling technology for pen- or notepad-based computing systems. But while there is much excitement and enthusiasm about wireless networks, the technology is still in its infancy (much like pen-based computing), and it must overcome a variety of technical and regulatory hurdles before it becomes a major component in today's computer systems. In this article, I'll take a look at the primary types of wireless technologies and their current status.

It is not realistic to expect wireless networks to replace unshielded twisted-pair and other hard-wired networks. Cable offers much higher data transmission speeds than are possible with wireless technology and will continue to do so for the foreseeable future. While most wireless networks offer maximum speeds of about 2 Mbps (many systems, as I will discuss later, are considerably slower than that), UTP systems operate at a minimum of 10 Mbps and are expected to reach speeds of 100 Mbps in the next two years. Fiber-optic (Fiber Distributed Data Interface, or FDDI) cable systems will

achieve even faster transmission rates, while wireless networks will reach maximum speeds of only 10 Mbps. Clearly, wireless systems cannot compete with wired networks with regard to performance.

Wireless systems will, however, nicely complement wired networks. According to Ken Biba of Xircom (a network hardware vendor mainly known for its pocket LAN adapters), "wireless will solve your last 10 to 50 meters." In other words, a wired network can serve as a primary, or backbone, system, with a wireless network providing additional mobility.

The Long and Short of It

There are two broad categories of wireless networks: long-distance and short-distance. Long-distance networks are designed to transmit data within a metropolitan area or across a country and are characterized by relatively low data transmission rates, in the 4.8- to 19.2-Kbps range. Short-distance wireless networks are primarily in-building networks with speeds ranging from 230 Kbps to 2 Mbps.

The two primary types of long-distance networks are public and private packet-switched radio networks and cellular-circuit-switched telephone networks. Cellular telephone networks are an expensive means of transmitting data. Cellular modems are much more expensive

New technologies and standards portend the era of mobile computing

INSIDE AN INFRARED TRANSCEIVER

The components of the Photonics infrared transceiver. The transceiver directs the beam of light to a passive surface, such as the room's ceiling, where the light transmission can be picked up by another transceiver.

than conventional modems, since they require special circuitry to handle the loss of the signal when the circuit is handed off or switched from one base station to another. This signal loss is not a problem for voice communications because the switch delay, which usually lasts a few hundred milliseconds, is not noticeable to the speakers. But it can play havoc with data.

There are many other drawbacks of cellular data transmission: phone-usage charges can easily add up; cellular transmissions are easily intercepted, which makes data security an issue; interference and transmission errors are a major concern; cellular data transmissions must compete for cellular lines that are already jammed with cellular voice transmissions; and transmission speeds are slow. All these drawbacks make cellular data communication appropriate only for small file transfers or perhaps for short database queries to a host computer. Nevertheless, advances in data compression, data security, and error-checking algorithms will make cellular

networks a viable option in some situations. Cellular modems will certainly play a role in wireless fax transmission.

The other major long-distance network option is the public packet-switched radio network. Packet-switched networks do not have the signal-loss problems that plague circuit-switched networks because the architecture is designed to support packets of data rather than voice communications. Note that private packet-switched networks, such as those used by public safety departments, government agencies, and electric utilities, use the same technology as the public variety but on restricted RF bands using an organization's own computer systems.

Public Radio Networks

The public radio network market has two major players: ARDIS, a joint venture of Motorola and IBM, and RAM Mobile Data, a company that uses the Mobitex mobile data network system developed by the Swedish company Ericsson AB. This system is widely used in Europe.

These public radio networks provide a series of radio channels in major metropolitan areas that are licensed by the FCC and are available for a fee to be used as long-distance networks. The user pays a monthly fee for air time and use of the mobile data equipment. The network company (e.g., ARDIS or RAM Mobile Data) provides the network infrastructure, which includes area network controllers and base stations, fault-tolerant computer systems, and so forth. Both these systems support the X.25 packet-switching standard as well as their own proprietary frame-relay packets. (For more on frame-relay packets, see the State of the Art section in the July 1991 BYTE.)

These public radio networks are fully documented according to the Open Systems Interconnection reference model (see "Remote Connections," July 1991 BYTE, for a complete description of the seven network layers that make up the OSI reference model). Both ARDIS and the Mobitex system specify the lower three network layers (i.e., physical, data link, and network) and provide flexibility in the application layers, allowing custom software and applications development. A small company called RF Data (Hinsdale, IL) has developed a data-compression routine for use on these public networks. Hardware developers also provide peripherals for use with public networks. For example, IBM has developed its PCradio for use with ARDIS and other Motorola-based public and private networks. The PCradio is a hand-held device with an 80C186 microprocessor running DOS, a built-in radio/fax/modem, an IC memory card slot, and 640 KB of RAM.

These public networks operate in the 800- to 900-MHz frequency range. ARDIS offers a data transmission speed of 4.8 Kbps, while Mobitex operates at 8 Kbps. Motorola recently introduced a new version of its public radio network technology that operates at 19.2 Kbps in the U.S. (and at 9.6 Kbps in Europe due to a narrower frequency band). The ARDIS system will eventually migrate to this new Motorola network technology.

Public radio networks such as ARDIS and Mobitex will play a significant role in the LAN market, particularly for large corporations with widespread field-service activities. For example, Otis Elevator uses the ARDIS system for its field-service organization. But, as with cellular technology, these networks are limited by their low data transfer rates and are not practical for large file transfers. They are appropriate only for two-way messaging, short-duration transactions, and small file transfers.

WIRELESS NETWORKING TECHNOLOGIES

A comparison of wireless network media. (Table courtesy of Photonics Corp.)

| | Public networks | In-building microwave | Cellular modems | Spread-spectrum | Infrared |
|---------------|-----------------|-----------------------|-----------------|-----------------|---------------|
| Speed | 4.8–9.6 Kbps | 10 Mbps | 2.4–16.8 Kbps | 0.23–2.0 Mbps | 0.23–10 Mbps |
| Range | Wide area | Building | Wide area | 20–100 meters | 20–200 meters |
| Cost per node | \$100/mo.* | Unknown | \$100/mo.* | \$300–\$1400 | \$250–\$300 |

* Monthly charges vary according to usage (these examples are at the low end).

Wireless LANs

Wireless LANs differ from conventional wired networks primarily in the physical and data-link layers of the OSI reference model. The physical layer simply describes the method by which the bits of data are transferred from one node to another. The data-link layer (also called the media access control, or MAC, layer) describes how those data bits are packaged and error-checked. The higher layers generally conform to existing network protocols or use bridges, routers, or gateways to connect to them.

The two methods of implementing the physical layer in a wireless LAN are radio frequency and infrared light transmission. Infrared systems are primarily limited to a single room, since the receiver and transmitter must be able to see each other. There are, however, infrared building-to-building networks in which the transceivers are placed in windows of adjacent buildings.

RF transmissions have one major disadvantage: government regulations over the use of radio frequencies. Currently, there are no RF bands in the U.S. for the exclusive use of wireless LANs other than narrow-frequency bands licensed by private companies (e.g., Motorola or RAM Mobile Data) for commercial applications. The same situation is true for the rest of the world, and, to make matters worse, there are no international standards for RF data transmissions. Therefore, different countries have different regulations and allocate the same frequency bands for different uses. However, efforts are under way to establish an international standard for RF transmissions.

Infrared does not have this problem and is, therefore, an attractive alternative to RF wireless LANs. The principle of infrared data communication has existed for many years. In the late 1970s, Hewlett-Packard introduced its HP-41 calculator, which used an infrared transmitter to operate a portable thermal printer. HP, as well as other manufacturers, uses infrared communications in calculators and other

electronic devices. Of course, infrared is used in remote controllers for TVs, VCRs, and stereos. The same principle used in these devices also applies to the use of infrared communication on a wireless LAN: The infrared light is beamed from one transceiver to another, and the light transmission is encoded and decoded at the sending and receiving ends into a protocol compatible with existing network protocols.

The pioneer in the development of infrared networking is Richard Allen, who founded Photonics Corp. in 1985 and developed an infrared transceiver. The first version of this transceiver, developed for end users, directed the infrared beam of light to a passive surface in the room—usually the ceiling—where another transceiver could pick it up. Multiple network nodes can be installed in a single room by using a limited passive area for each transceiver.

To set up a room with infrared transceivers, you simply aim the transceivers at a common spot on the ceiling. A green light on the transceiver illuminates when the alignment is correct. See the figure for an illustration of the Photonics transceiver. To date, Photonics has only developed an AppleTalk/LocalTalk version of this transceiver, called Photolink, that operates at 230 Kbps. The system has a range of up to 200 meters.

Photonics has also developed a miniaturized version of the transceiver for use as an OEM product in laptops and notebooks. This version uses the principle of diffused infrared light, in which the beam of light is diffused throughout the entire room and picked up by other computers or terminals containing infrared transceivers. In addition, Photonics is working on an Ethernet version of its portable transceiver and claims the unit has transmission speeds of up to 1 Mbps.

Prices for the transceiver in OEM quantities start at \$20. This makes it an affordable add-on for pen-based or other portable systems.

While Photonics is currently the main

player in the infrared market, you can expect other companies to make some moves. BICC Communications (Auburn, MA) has developed a Token Ring-based infrared transceiver that requires you to install a central transmitter in the room. The IEEE 802.11 wireless networking group is currently working on a standard MAC layer for infrared networks.

RF Wireless LANs

In 1985, the FCC allowed unlicensed operation of devices using less than 1 watt of power in three frequency bands: 902 to 928 MHz, 2400 to 2483.5 MHz, and 5725 to 5850 MHz. These frequency bands, called ISM bands, had previously been limited to licensed industrial, scientific, and medical instruments. Network vendors therefore began developing devices for networking within those frequency bands.

Unlike licensed frequency bands, such as those used by ARDIS and Mobitex, ISM bands are open to everybody. To minimize interference, FCC regulations stipulate that a signal transmission technique called *spread-spectrum modulation*, which has a maximum transmitter power of 1 W, must be used within the ISM band. This technique has been used for military applications for many years. The basic idea of spread-spectrum modulation is to take a conventional narrow-band signal and distribute its energy over a much wider frequency domain. Thus, the average energy density is far lower in the spread-spectrum equivalent of the original narrow-band signal. In military applications, the objective is to reduce the energy density below the ambient noise level so that the signal is undetectable. The idea in commercial radio networks is to be able to receive and send signals with minimal interference.

There are two techniques used for distributing the conventional narrow-band signal into a spread-spectrum equivalent: direct sequencing and frequency hopping. In the direct-sequence method, the incoming bit stream is multiplied by a

higher-frequency signal based on a predetermined spreading function. The original data stream can then be recovered at the receiving end by correlating it with the known spreading function. This technique requires a computationally powerful device, such as a digital signal processor, to correlate the incoming signal. Currently, the fastest spread-spectrum device is the NCR WaveLAN spread-spectrum radio, which uses direct sequencing at a speed of 2 Mbps. Current technology allows a range of about 100 meters.

Frequency hopping is a technique in which the receiving and transmitting devices move synchronously in a predetermined pattern from one frequency to another, both hopping at the same time and in the same predetermined sequence. As in the direct-sequence method, the data must be reconstructed based on the frequency-hopping pattern.

While spread-spectrum modulation is a viable method for wireless networking, the current allocation of ISM bands is proving inadequate due to the competition with other devices in these bands. For example, the higher ISM bandwidths (2.4 and 5.8 gigahertz) have microwave ovens to contend with.

Many proponents of various wireless approaches like to point out that competing wireless approaches have big security problems. But, according to Xircom's Ken Biba, security is more of a red herring. Most, if not all, network vendors in the wireless field use some form of data encryption. In spread-spectrum applications, the spread-spectrum function itself is a form of data security. And, as Biba points out, hard-wired Ethernet cables make excellent antennas. In other words, security is probably not any more of a problem with wireless networks than it is with other methods of data communication.

The Data-PCS

The inadequacies of ISM bands have prompted Apple to petition the FCC to establish a dedicated frequency bandwidth for data transmissions, called the Data-PCS (for personal communications service). Apple has requested the FCC to allocate 40 MHz within the 1850- to 1990-MHz bandwidth strictly for data communications. According to the petition, "an allocation of 40 MHz is sufficient to permit several Data-PCS networks operating at rates of up to 10 Mbps, for example, to coexist in the same geographic area today, as well as to motivate technological innovations that can lead to higher data rates in the future."

Apple's petition states that the company performed extensive testing of the current

ISM bands using spread-spectrum modulation and found that "there is a strong likelihood of unpredictable, essentially uncontrollable, interference in the ISM bands." Apple's extensive testing also indicated that the 1850- to 1990-MHz frequency band provides the optimum propagation characteristics for data communications.

According to the Apple proposal, the dedicated bandwidth would conform to "Part 15" rules, or, in other words, would continue to require spread-spectrum devices to have a transmitter power of under 1 W. The petition further requests that the FCC require data to be transmitted on the Data-PCS in "packetized form." This requirement is already met by all major network protocols. In addition, Apple's petition requests that manufacturers should have the right to maintain proprietary encryption schemes for data transmitted via the Data-PCS.

The petition also asks that the FCC release 10-MHz increments for the Data-PCS in two-year intervals starting this year. Thus, it will be a slow process before a full-fledged dedicated data radio LAN will be fully functional.

In-Building Microwave

In the meantime, alternatives to unlicensed spread-spectrum modulation are available from private companies such as Motorola, which recently introduced its first wireless in-building network that supports Ethernet LANs at 10 Mbps. Called Altair (not to be confused with the old Altair microcomputer), the system uses a centrally located control module that can support up to 32 Ethernet devices within an office area of approximately 5000 square feet. The Ethernet devices are connected to a user module located on the desktop and transmit data using conventional frequency modulation at 18 gigahertz to and from the control module. While the Altair system provides a wireless solution for the desktop office environment, it does not address the need for *mobile* wireless communications, which spread-spectrum radio and the Photonics portable infrared transceiver do provide.

In the European market, Olivetti has introduced a wireless LAN based on the Digital European Cordless Telecommunication standard. DECT uses a star topology in which each device in the star transmits to the server at a speed of 1 Mbps. The exact frequency range of the DECT LAN has not yet been specified, but it will be in the microwave frequency range using conventional FM, probably around 18 gigahertz. More specific details are expected early this year.

Wireless LANs and Mobile Computing

The table summarizes the different types of wireless networks discussed in this article. As I mentioned earlier, wireless networks will be a key component in mobile notebook and pen-based computer systems. In fact, without wireless networking, much of the utility of a pen-based system is lost. The idea of working in the field with an electronic notepad from which you can query a host database or transmit a fax to the home office is a crucial concept in the pen-based computing model.

Several issues must be considered in the development of wireless network environments. From a software perspective, wireless networks require a different approach than wired networks. In particular, network connectivity can be easily interrupted in a wireless network if, for example, the wireless user walks outside of the range of the radio or infrared signal. Therefore, network software for wireless systems must provide methods for seamlessly detaching and reconnecting to the network without crashing either the network or the remote node. Ideally, the network would be able to interrupt a data transmission and pick up where it left off when the network was reconnected.

Go Corp.'s PenPoint operating system has addressed this problem in its wired networks by incorporating a feature called "detachable networking." By unplugging the network cable, the PenPoint user automatically suspends network operations. Presumably, the same approach would work for wireless systems. Nevertheless, it's unknown how the network server would respond to these interruptions.

Regardless of the technical challenges that face wireless networking, all will be for naught unless the regulatory challenges are overcome. The FCC must allocate a dedicated frequency band for data communications. As Apple's proposal points out, the current shared usage of ISM bands is simply too unreliable for data communications. In addition, international standards must also be established, allowing U.S. and foreign vendors to be able to design internationally supported wireless network systems. Hopefully, the IEEE 802.11 committee and its foreign counterparts will be able to establish working standards in the near future. In any event, the next few years should deliver some exciting new developments in the field of wireless networking. ■

Nicholas Baran is a consulting editor for BYTE and coeditor of Pen-Based Computing (Sandpoint, ID). He can be reached on BIX as "nickbaran."

BATCH-FILE TOOLKIT

I feature three DOS enhancers this month: Need, Get, and Ask. Each adds significant features to the batch-file programs you write. If, like me, you stopped writing DOS batch files long ago out of boredom and frustration, you may find that these utilities rekindle your interest in batch-file programming.

A Friendly Environment

Need, which includes Avoid and Sniff, ensures a friendly hardware and software environment. You can use these three programs to see if Desqview is running; to determine if there's sufficient conventional, extended, or expanded memory; to determine if the CPU is a 386 or higher; or to check for a host of similar conditions. Need includes numerous hardware and software tests to determine if a machine meets all your requirements.

You tell Need what you want. It tests the computer's configuration and sets DOS's ERRORLEVEL variable to 0 if all is OK or to 1 if one or more of the conditions you specified could not be met. You can check the ERRORLEVEL inside the batch file and decide if your batch file should continue, abort, or alert the user.

These batch-file enhancers extend the capabilities of DOS

Avoid is the opposite of Need; it helps you avoid certain hardware/software combinations. Finally, Sniff will return configuration information that you can read.

What DOS Leaves Out

Get supplements the DOS batch-file commands. It turns batch-file programming into macro-language programming. Like Need, Get queries the hardware and software configurations of a system. However, Get also prompts for input and sets system parameters. This utility can ask questions, get disk and file information, get hardware or software information, do screen output, and toggle system settings.

Get's command-line parameters let you get and put strings; set screen color and video mode; and get the DOS version, file size, free disk space, disk size, current directory, and volume label.

Typically, Get sets an environment variable that you can test after Get completes.

For example, you might code the following

```
GET N "Answer yes or no: "
IF "%GET%"=="N" goto NO
IF "%GET%"=="Y" goto YES
```

to get a yes or no answer from the person running your batch program.

Just Ask

Use Ask to get multiple-choice answers to questions you submit to the user. Ask puts a string in the master environment containing the user's answer, and you can easily test the string to know what to do next in your batch-file program. You can even use Ask to build menus inside batch programs. You might use Ask to determine which program to launch, or to force a compiler or linker to use a certain set of options or libraries.

You can use Roedy Green's Need, Avoid, and Sniff for free, but you must pay the \$15 registration fee to get the assembly language source code. Get is a \$15 shareware program developed by Bob Stephan. Ask, written by Jay Vanderbilt, is free. ■

UNIX/Ben Smith

Noninteractive Unix

Computing implies automation. But since the advent of interactive programs, where users control the program as it runs, the ability of a program to run noninteractively (i.e., in batch mode) has sometimes been neglected by programmers. This trend has even infected the Unix software world, where traditionalists have usually ensured that their programs (e.g., mailx) can run both interactively and in batch mode.

To patch some of these holes that liberal-minded developers have created, Don Libes developed *expect*. This utility program performs programmed dialogue with those trendy, user-interactive programs that haven't been designed for use in a world of automation. This is a public domain program. Libes, who works for the National Institute of Standards and Technology, is the coauthor of *Life with UNIX: A Guide for Everyone* (Prentice-Hall, 1988).

MAC/Tom Thompson

Solving Virus Crimes

A computer virus is one of those subjects you'd rather not hear about—until one "roaches" your Mac's hard drive, taking the day's work with it. Worse, like their biological counterparts, new viral strains appear that bypass protective detection software that's only familiar with existing viruses.

Virus Detective 5.0 by Jeffrey Shulman is a \$40 shareware desk accessory that scans hard drives and floppy disks for viruses. What's important about Virus Detective is its programmability: You can type in new code signatures so that Virus Detective will recognize new viruses. Virus Detective can read text files with new code signatures. Thus, an update is often only a matter of logging onto an on-line service and downloading the latest signature file. Virus Detective's programmability ends the arms race between the virus creator and victim once and for all—not a bad bargain.

Editor's note: Software Corner highlights public domain, freeware, and shareware programs. The programs are available on BIX (in the sw.corner conference), from Demolink, and on disk. See "Program Listings" on page 5 for details. We solicit contributions and pay \$50 for any program we use. Write to: Software Corner, BYTE, One Phoenix Mill Lane, Peterborough, NH 03458.

WHY SOFTWARE COMPANIES ARE CHOOSING HARDLOCK™

Actual size shown.

Hardlock — programmable, algorithmic response and memory option — all in one

**GLENCO
ENGINEERING INC.**
SERVING THE SOFTWARE INDUSTRY SINCE 1979

270 Lexington Drive
Buffalo Grove, Illinois 60089-6930
(708) 808-0300 FAX 808-0313
1-800-562-2543

See us at **COMDEX** Booth #W2946 **1-800-562-2543**

Developers Say...

"Since the Hardlock uses an algorithmic response chip, I am assured of the highest level of protection. Also, the optional programmable memory means I can keep custom configurations in Hardlock rather than in a file. I can protect my .EXE or .COM files directly and/or incorporate Glenco's high level language interface routines into my software. And, I feel confident I'll have Glenco's support if I use other programming languages."

Accountants Say...

"Hardlock provides our company with a healthier bottom line. Since our software can't be copied, our revenue has steadily increased. The unique programming board allows us to program the Hardlock in seconds. This ensures optimum delivery schedules from Glenco and a lower inventory cost for us. Hardlock's field programmable feature means a single Hardlock can protect more than one product."

End Users Say...

"Hardlock allows me to backup my software investment. I just plugged Hardlock into the printer card, connected the printer cable, and forgot about it. Since Hardlock doesn't require a battery, I am assured of reliability and no down time."

HARDLOCK™
The Preferred Protection System!

MARTIN
HELLER

INSIDE 386 ENHANCED MODE

Windows is divided into three parts: the kernel, the user, and the Graphics Device Interface (GDI). Although that's the basic architecture, there is more to heaven and earth than is dreamt of in this philosophy. Windows also acts as a DOS extender (DOSX) to work in protected mode.

Most Windows programmers are unfamiliar with DOSX because its documentation is in the Windows Device Driver Kit (DDK). Most programmers have their hands full learning the Windows application programming interface (API), as explicated in the Software Development Kit. I'll try to remedy this.

Standard mode and enhanced mode have quite different DOS extenders. Standard mode works in the protected-address segmented 16-bit mode of a 286 CPU; extended mode sets up 386 virtual machine environments underneath a paged 32-bit virtual machine manager (VMM). Standard mode is really pretty simple; enhanced mode is not simple at all.

Virtual Concepts

What is a virtual machine? Imagine you are a program. You think you have control of a computer, but you don't: The operating system has simulated a computer to fool you. You can't affect programs running in other VMs; you can't even tell they're there.

The enhanced-mode Windows implementation of a VM has a memory partition (i.e., an area to save processor registers) and a control block (i.e., data structures to implement virtualization of the other aspects of a PC, such as ports, I/O controllers, DMA controllers, video interfaces, and interrupt tables). In other words, a VM maintains a complete description of the state of an application and lets a program execute as though it were running on a 386 in real mode.

An ordinary real-mode program will be fooled by a VM. A somewhat more so-

phisticated program will detect that it is running under enhanced-mode Windows using an INT 2F hexadecimal service and, perhaps, modify its behavior to allow for better multitasking. The most sophisticated programs know they are running in a VM and can take advantage of it, using INT 33h services to access the DOS Protected Mode Interface and INT 2Fh services to access other enhanced-mode services. With DPML, an application can even go into protected mode.

Not every extended-DOS application is compatible with DPML. But the major DOS-extender vendors—Phar Lap Software, Rational Systems, and Ergo Computing—have updated their products to work with DPML.

The system VM is automatically creat-

ed when enhanced mode initializes. It always has a protected-mode portion that is used to run the Windows desktop. Yes, that's right: What you think of as Windows is running in a VM. The Windows desktop, too, is fooled into thinking it has the whole machine, when it is just the first of many VMs.

Below all the VMs is a VMM, which takes care of allocating memory, CPU time, and peripherals. The VMM and the virtual device drivers (VxDs) run in one flat-model 32-bit memory segment. To write VxDs, you need to write 32-bit programs; 32-bit versions of Microsoft Macro Assembler and Link come with the DDK for that purpose. Windows comes with VxDs for the screen, keyboard, mouse, and serial ports, as well as virtualization support for lower-level hardware.

Things your mother never told you about Windows

VM Details

When enhanced mode starts up, VMM and the virtual devices specified in SYSTEM.INI load. The VMM and all the VxDs initialize, the system VM is created and initialized, and, finally, the shell VxD executes Windows. The shell VxD calls V86MMGR services to set up VMs. To start a DOS VM, it uses V86MMGR_Allocate_V86_Pages to allocate memory pages for the VM's base memory and map them into the VM. Then it uses V86MMGR_Set_EMS_XMS_Limits to allocate memory pages for EMS and Extended Memory Specification and connect those pages to the code that handles EMS and XMS interrupts.

A value of 0 for the minimum and maximum size (normally set in a program information file) will disable access to EMS or XMS services; a value of -1 will set no limit. For instance, setting EMS memory for a FoxPro application to a minimum of 1024 and a maximum of -1 means that the database will see as much expanded memory as possible, at least 1 MB, or the application won't run.

What about having multiple DOS VMs?

continued

In its V86-mode memory map, each VM has its own local set of interrupt vectors, its own display memory, and its own local application code and data. Each also has a map to global memory regions that hold MS-DOS and the loaded DOS device drivers, any network and TSR program code loaded before Windows starts, a portion of Windows/386, and the system ROM. All the above run at privilege ring 3 (the lowest level).

The protected-mode portion of a VM runs at privilege ring 1, 2, or 3. Every VM also has a control block and a client stack at privilege ring 0 (the highest level). The control block contains, among other things, data used by the system VxDs to maintain the state of, for example, the physical hardware across all VMs.

The enhanced-mode Windows VMM has a two-level scheduler that preemptively allocates time among the VMs. The

A VM lets a program execute as though it were running on a 386 in real mode.

primary level of the scheduler scans the execution priority of all VMs and lets the VM with the highest priority run. The secondary level is the time slicer, which dynamically alters the execution priorities of VMs based on the current time and their foreground and background time-slice priorities.

When application code in a VM issues a software interrupt or causes a protection fault, the 386 protection mechanism causes a privilege-ring transition. Control transfers to the VMM, which, in turn, dispatches the interrupt to the appropriate VxD. If your program issues a DOS call (e.g., INT 21h), the software interrupt will cause a privilege-ring transition. Instead of directly executing the DOS function, the program flips into the VMM, which makes sure that the DOS function is allowed before it passes control to DOS.

There's much more to enhanced mode, but that's the gist of it. You can find out more from the DDK and by poking around

with an enhanced-mode debugger (e.g., Soft-Ice for Windows).

Class Libraries, Redux

My collection of class libraries for Windows continues to grow, with something old—Glockenspiel's CommonView 3.0—and something new—the Microsoft Foundation Classes (MFC). CommonView, which is distributed in the U.S. by ImageSoft, supports Borland C++ as well as Glockenspiel's own C++ translator coupled with Microsoft C 6.0ax. It targets Windows, Presentation Manager, and OSF/Motif in a portable way. CommonView's classes cover the user (i.e., window and dialog-box management) and GDI (i.e., graphics) parts of Windows fairly well. Borland's ObjectWindows covers the user but not the GDI. CommonView comes with container classes and a memory management dynamic link library.

MFC, which ships with Microsoft C/C++ 7.0 for Windows, covers most of the Windows API, including hard parts like Multiple Document Interface and Object Linking and Embedding. MFC has container classes that can also be used in DOS applications, but its main purpose is to encapsulate the Windows C interface. You want portability? It's portable only as far as the Windows API is portable, but the Windows API could go places you'd never have expected. Stay tuned.

MFC is a thin layer. There's relatively little overhead and relatively little abstraction. The MFC sample applications seem as quick as their C counterparts. At the same time, many of the MFC classes were designed specifically to be extended by inheritance, which makes MFC a better building block than less-extensible application frameworks.

Anything with a handle in Windows becomes an object in MFC—an object with almost the same name as its API counterpart. What's the main thing with a handle in the GDI? A device context. How do you draw in a window in MFC? You construct an item of class CDC and then use its member functions: CDC::MoveTo, CDC::LineTo, CDC::TextOut, and so on. Do you have to use the classes? No; it's OK to mix in your old C code. I think I'm going to like MFC.

Nasty and Nice Surprises

I mentioned in a previous column that I was producing the final pages of my book with Word for Windows 2.0. I was able to produce perfectly acceptable individual pages with WinWord, but I couldn't get facing pages to align at the top and bottom to save my life.

Fine, I thought. I'll just flow the book into PageMaker. After all, I'd tested for this possible exigency with Word 1.1. Microsoft wouldn't dare break such an essential function in a new version.

Wrong. PageMaker 4.0 can't import WinWord 2.0 format, nor can it import WinWord 2.0 Rich Text Format output. I tried sending RTF to the Mac. I was able to get Mac PageMaker to read the files only by first opening and saving them from MacWord. My text came across, but none of my illustrations survived the process.

As it happened, there was a copy of Image-In-Color in my pile of things to examine. It produces TIFF files acceptable to Mac PageMaker. I copied all the bit maps out of my WinWord files, saved them as BMP files (using the Image2 application from my book), and then converted each BMP file to TIFF with Image-In-Color.

Happy ending: The book got to the printer complete with all its illustrations, albeit a few weeks later than I had hoped. My apologies to anyone who scoured bookstores looking for a copy of it in early January. ■

Martin Heller develops software and writes about computers, despite a Ph.D. in physics and despite having worked, literally, as a rocket scientist. He is the author of Advanced Windows Programming (Wiley, 1992).

ASK BYTE

Video Downsizing

I want to obtain a high-performance PC on a moderate budget. These systems often include 1024- by 768-pixel monitors that are compatible with standard VGA but not with older video graphics standards (e.g., MDA, CGA, and EGA). I am interested in a video adapter capable of displaying these older video modes.

Do video controllers supplied with high-resolution monitors typically support the older standards? If so, could I simply unhook the high-resolution monitor, configure the video software drivers to older modes, and plug in another monitor?

Thomas A. Williams
Waterford, MI

ATI Technologies (3761 Victoria Park Ave., Scarborough, Ontario, Canada M1W 3S2, (416) 756-0718; fax (416) 756-0720) has just the video adapter for you. While many high-resolution video boards let you run EGA- or CGA-mode programs on your VGA monitor, they do not give you dual connectors so that you can attach an EGA or a CGA monitor. The ATI VGAWonder XL gives you 15-pin (analog) and nine-pin (digital) video connections and a mouse port as well. The board supports resolutions of up to 1024 by 768 pixels, as well as VGA, MDA, EGA, and CGA modes. ATI's suggested list price is \$399 with 1 MB of video RAM, but you can find it for considerably less.

Many clone vendors will build a system to your specifications and will be happy to substitute the VGAWonder XL for their standard video board. —Stanford Diehl

Windows Environment Revisited

In the October 1991 Ask BYTE, Paul M. Smith brought up a common problem in the DOS community: Running a batch file that sets an environment variable in a DOS window produces an "Out of environment space" error message. The cause of this problem and the fix, however, have little to do with the `windir` variable produced by Windows 3.0.

When started, Windows inherits an environment equal to the parent's current environment. This includes the variable set and the size currently used. Setting an environment size in `CONFIG.SYS` (e.g., `SHELL=C:\COMMAND.COM /P /E:256`) is the first step. This gives the initial environment a size of 256 bytes. The environment can grow to 256 bytes, but once you start a program, its inherited environment size is limited to what is currently used. The only fix is to add the `/E:256` switch to the `COMMAND.COM` in Windows.

If you open a DOS window or start a batch file without a program information file (PIF), change the command line under program item properties to `C:\COMMAND.COM /E:256 [/C batchfile.bat]`.

If you use a PIF, set the program filename to `COMMAND.COM` and change the optional parameters to `/E:256 [/C batchfile.bat]`.

Both options start up `COMMAND.COM` with an ini-

tial environment size of 256 bytes. You can change the environment size to any value between 160 and 32,768.

This problem is inherent in nearly all programs that have a shell to DOS or DOS window function (Desqview somehow avoids it). The fix is the same in all cases (provided that the program lets you change the shell/window command). It would be nice if developers would check for the initial environment size setting and use it in their shell/

window function.

Here's one little memory-squeezing tip: When loading TSR programs in your `AUTOEXEC.BAT` file, do so before setting an environment variable (e.g., `PATH` or `APPEND`). Because a TSR also inherits the current environment, keeping it as small as possible saves a few precious bytes of memory. The exceptions are those "intelligent" TSRs that release the unneeded environment back to the memory pool.

Spring City, PA

The Working Font

I use Adobe Type Manager and a Qume ScriptTen PostScript printer. I have 13 fonts to use with ATM. I wanted to add more fonts using the WFN Boss utility included with CorelDraw 2.0. The utility converts fonts from Corel format to Adobe Type 1 format.

I converted many fonts with WFN Boss. When I used ATM to add these new typefaces, it did so perfectly. But when I tried to print a PageMaker file, all the fonts I had converted printed in Courier. How can I use the fonts converted by WFN Boss to work with other Windows applications?

Jean Lauzier
Val-Brillant, Quebec, Canada

Corel has made improvements to the WFN Boss utility in CorelDraw 2.01. Register your software if you haven't done so and ask for the upgrade.

It also sounds like you have not made some necessary modifications to your `WIN.INI` file. ATM assumes that typefaces are resident in your PostScript printer. Thus, it does not automatically download them for you. You must do it manually from the `WIN.INI` file. Load the `WIN.INI` file into your word processor and find the section where Windows lists the information on your PostScript fonts. The section will begin with the header `[PostScript,LPT1]` or something similar. You will want to edit the lines beginning with `softfontX=` to include the typefaces you have created. The lines will show a path to only the `.PFM` files. Go to the end of the line, insert a comma, and add a path to the `.PFB` files. The final result will look something like the following:

```
softfont9=c:\psfonts\pfm\newfont.pfm,  
c:\psfonts\newfont.pfb
```

Also, try using ATM's `PSDOWN` utility to automatically download the font to your printer. `PSDOWN` flushes

the font from your printer's memory after each print job. If you don't use it, you'll have to reset your printer after each job to free up memory.—Stanford Diehl

High-Resolution BASICs

I recently purchased a 25-MHz 386 computer with a Super VGA card (1024 by 768 pixels) and DOS 5.0. I wanted the higher resolution to program some graphics and animation. I want to work in BASIC and access this high resolution. So far, I have been unable to find out how to do this.

I am able to program in 640- by 480-pixel resolution. I can set the high-resolution mode in DOS (with the display card's DMODE utility), but BASIC sets it back to the lower resolution. Is it possible to have BASIC access the higher-resolution modes?

R. A. Fischer
Sun Lakes, AZ

It's a funny thing about standards—just when you get used to one, someone changes it. Versions of BASIC (and libraries for most other languages) usually support only the modes defined by IBM. That means 16 colors in 640- by 480-pixel mode or 256 colors in 320- by 200-pixel mode. There is a relatively small number of de facto Super VGA standards. The Tseng Laboratories 3000 and 4000 chip sets are popular among manufacturers, as are the sets used by Paradise, ATI Technologies, and Video Seven. To access the higher-resolution modes, you need a replacement graphics library that supports your video card.

You might contact Genus Microprogramming (2900 Wilcrest, Suite 145, Houston, TX 77042, (800) 227-0918 or (713) 870-0737; fax (713) 870-0288) and ask about its GX Effects library (\$199). It links into Microsoft QuickBasic 4.x or BASIC PDS 7.x and gives you sprite animation, sound, music playback, Sound Blaster file playback, and many other features. You might also want Genus's \$249 PCX Programmer's Toolkit if you're working with .PCX files.

The current versions of both Genus products support the Trident, Paradise, ATI, and Video Seven cards in 800- by 600-pixel display modes, and cards based on the Tseng Labs 4000 in 1024- by 768-pixel mode. New versions (possibly available by the time you read this) will support all these cards and the Video Electronics Standards Association specification in 1024- by 768-pixel mode.—Howard Eglowstein

Resolving Conflict

If Cliff Millward's ScanJet/video board conflict is like mine (Ask BYTE, December 1991), he can cure the problem by changing video boards. When I added a ScanJet Plus a few years ago, my Paradise VGA Plus 16 from Western Digital Imaging would no longer work in 16-bit mode. According to Hewlett-Packard and WDI, the video and scanner interface boards compete for the same memory area. I replaced the Paradise board with an Orchid Technology ProDesigner Plus, which runs in 16-bit mode and politely avoids trampling scanner memory.

I have just replaced the ProDesigner Plus with an Orchid Fahrenheit 1280, and it runs correctly in 16-bit mode with the ScanJet Plus active. I suspect that Orchid's popularity with the graphics crowd, who are likely to use a scanner, caused the firm to design its boards this way. (Contact Orchid Technology, Inc., 45365 Northport Loop W, Fremont, CA 94538, (800) 767-2443 or (510) 683-0300; fax (510) 490-9312.)

David Ellis
Torrance, CA

CNS on the Move

In the August 1991 Beyond DOS, Martin Heller discussed CNS's C++/Views software. I have been unable to locate the company.

Stacey Wohleber
Huntsville, AL

CNS has moved. Its new address is 1250 Park Rd., Chanhassen, MN 55317, (800) 843-2978 or (612) 474-7600; fax (612) 474-6737.—Raymond GA Côté

CPU Upgrade Issues

I have an IBM PS/2 Model 50 Z. I want to upgrade my system to a 386 processor, but I have found some problems in doing so. In Chile, we do not have as much information about products coming to market.

IBM of Chile has an Aox card to upgrade my system, but it is very expensive. The 25-MHz MicroMaster 386 sells for \$2000. I know there must be other cards. Can you provide me with the names of manufacturers? I would also appreciate references to any articles published on this topic.

Julio Rodiño Durán
Santiago, Chile

Installing upgrade boards into 286 systems is complicated and expensive. Do so only if you are an experienced user. BYTE has not evaluated any 386DX upgrade boards, but we have covered 386SX upgrade boards (see "SX Upgrade Boards: Not for the Fainthearted," April 1991 BYTE). We also covered two SX upgrade boards in the October 1991 Reviewer's Notebook. One of them was the SX/Now, a product for the Model 50 Z from Kingston Technology Corp. (17600 Newhope St., Fountain Valley, CA 92708, (714) 435-2600; fax (714) 435-2699). The 25-MHz SX/Now upgrade sells for \$625.

As you mentioned, Aox (486 Totten Pond Rd., Wal-tham, MA 02154, (617) 890-4402; fax (617) 890-8445) offers the 25-MHz upgrade for your system. It has a list price of \$1549. You should also consider 20-MHz versions from both of these companies. You'll give up some performance but save money.—Stanford Diehl ■

The BYTE Lab welcomes your questions. Address correspondence to Ask BYTE, BYTE, One Phoenix Mill Lane, Peterborough, NH 03458. You can also send BIX mail c/o "editors."

We read every letter, but due to the volume of mail received, we cannot guarantee a response. We edit all letters for clarity and brevity. Letters appear in BYTE about four months after we receive them.

service and support.**

COMMUNICATION

Quatech produces a full line of serial and parallel adapters for PS/2, PC-XT, AT and compatible systems available in RS-232, RS-422, RS-485 and Current Loop. Selectable addresses and interrupt capabilities are featured in our multi-port/user, SDLC, HDLC, and X.25 adapters. Software and 16550 UARTS are available.

DATA ACQUISITION

Quatech has developed a full line of data acquisition products for the IBM AT and compatibles. These high performance, low cost boards provide analog-to-digital, digital-to-analog, and digital input/output functions. A/D and D/A converters are equipped with 8, 12, or 16 bit resolution, and sampling rates up to 1 MHz.

Get A Lode Of This.

Our Three-Way Guarantee Just Got Better.

The LodeStar Three-Way Personal Guarantee has always been one of the industry's most comprehensive. But now it just got better. Introducing The LodeStar Five-Way Personal Guarantee. Now, every LodeStar system is covered five ways to insure your complete satisfaction. And that should take a lode off your mind.

1. MONEY BACK GUARANTEE.

If you change your mind for any reason simply return your LodeStar system to us in original condition within 30 days of your receipt and we'll refund your money.

2. FREE LIFETIME TECHNICAL SUPPORT.

For as long as you own your system, we'll give you FAST, FREE unlimited technical advice and guidance from our expert staff. This includes any support needed to upgrade or modify your system.

3. FREE LIFETIME LABOR SUPPORT.

Although you will probably never need it, for as long as you own your system, it will be protected by our 100% labor warranty.

4. FREE 2-YEAR PARTS WARRANTY.

For a full two years after purchase, your LodeStar computer will be covered by our 100% parts warranty, with fast turn around on any replacements.

5. FREE 1-YEAR ON-SITE SERVICE.

For a full one year after purchase, you'll have the added security of our coast-to-coast FREE on-site service.

Modulless Upgradeables

Carry A Greater Lode In The Future

Easy and inexpensive upgrades are built right into your LodeStar Starflex computer. Unlike conventional modular upgradeable systems from other Companies, you can upgrade your LodeStar Starflex system at a fraction of the cost all the way from 386DX to 486SX or 486DX, at any clock speed.

Thanks to our unique non-proprietary Modulless Upgrade design, LodeStar Starflex systems can be upgraded by simply plugging in the new chip and oscillator that comes in their inexpensive upgrade kit. Another bright idea from LodeStar-It's just that simple!

Every LodeStar computer is fully loaded with value. This includes unsurpassed quality throughout. To make certain of this, every system is individually pre-tested and burned-in for 72 hours prior to shipment. And of course, we stand behind our quality with our comprehensive Five-Way Personal Guarantee. You will see this quality all the way from our StarView SVGA Non-Interlaced Monitors with flicker-free image, to our own StarKey extended keyboards. And we pack in even extra value by pre-loading MS DOS 5.0 & Windows 3.0, as well as a Hi-Res 400 DPI serial mouse on every system. And our systems can be upgraded to include optional cache, RAM, more hard disk capacity, larger monitor, and a host of other enhancements you may require. Add it all together - stellar performance, brilliant quality, and guarantee that outshines all others - and you've got LodeStar.

Smooth Translation At A Scaled Down Price . . . And That's No Fish Tale!

With the LANCAST Twisted-Pair/Coax Translator, incompatibility in your network is a thing of the past.

This unique translation product bridges the gap between Coaxial based Ethernet LANS and the newer generation of IEEE 802.3 10Base-T Twisted-Pair LANS. By translating the signals between the

two LAN media types, your network can operate smoothly and efficiently with no loss of network integrity or capability. What's more, we do it at a price that fits your budget.

Smooth translation at a scaled down price of \$295.00, it's no wonder that many major computer firms are using the "twister" Translator. Call today for a free product brochure.

The "twister" Translator, Transceivers, Network Interface Cards, Repeaters, and other fine essential connectivity products are now available from LANCAST.

2 Gb

SCSI Portable DAT

\$1499

APS Portable DAT provides these features:

Compact size and a light weight – based on Archive's Python 3.5-inch DAT mechanism, the unit measures 6 x 8 x 2.5 inches and weighs under 4 pounds.

Extremely high capacity – 2.0 Gigabytes on the 90-meter Maxell™ DAT cartridge supplied with purchase.

High speed random access to any file on tape.

Uncorrectable error rate of less than 1 in 10¹⁵ bits.

Four Direct-Drive motors (4DD) eliminate belts and mechanical mode changes.

PC DIAGNOSTICS MADE EASY

SPEED TEST YOUR PC

You've seen the **Landmark Speed Rating** advertised by many major PC manufacturers, now you can have your own copy of the **Landmark System Speed Test™**. Accurately measure CPU, math, and video speeds to make an informed purchasing decision, determine the best PC for the job or maybe just win some bets in the office on whose PC is really faster! Includes the Landmark AT CMOS RAM Setup program to update your system configuration on-the-fly. **CALL for current pricing!**

THE 5 MINUTE SOLUTION TO FLOPPY DRIVE FAILURE

With **AlignIt™** you can clean, diagnose, and align your floppy drives in minutes without a scope. Patented technology requires only a screwdriver to perform ANSI-accurate alignments (.3 mil).

AlignIt is ideal for corporate users with 2 or more PCs because it includes a "GOLD STANDARD" feature so you can align all your PCs to the same in-house standard, guaranteeing that all your floppies are perfectly interchangeable between PCs.

80% of all floppy drive failures can be fixed with **AlignIt**. So don't replace your drive, save time and money instead.

Includes dual size floppies, (both high and low density) and no-mess pre-lubricated cleaning diskettes (both sizes) good for 180 uses. Replacements and single drive size versions available. For all PCs and compatibles. **CALL for current pricing!**

PROFESSIONAL LEVEL PC TROUBLESHOOTING

Landmark Service Diagnostics™ is ideal for professionals requiring the most exhaustive diagnostic test capabilities. Each module is CPU specific, including PC, XT, AT, 386/486, and PS/2. Since 1981 major manufacturers like Wang, Xerox, Prime, Sony, DEC, NEC, and NCR have relied on Service Diagnostics to tackle their toughest operating problems.

Intended for professional service and repair technicians, **Service Diagnostics** is also easy to use for the novice. Clear, concise on-line help and intuitive menus make finding system problems a breeze. Tests all CPUs, math chips, all memory, floppy, fixed and non-standard disk drives, standard/non-standard printers, system board, video, com ports and all keyboards. Utilities include low-level reformat, log bad sectors, edit bad sector table; the partition editor allows you to set up multiple partitions; back-up program transfers hard disk image on unformatted floppies and allows for restore after reformat.

Ideal for UNIX and other operating systems, the self-booting version doesn't require DOS. The manual offers troubleshooting tips to the component level. Also available in a complete kit including: all CPU specific software, dual size floppy alignment software (see **AlignIt**), and PC/XT & AT ROM POSTs. **PC Magazine Editor's Choice 8/90.**

PC WON'T BOOT? THEN JUST KICKSTART IT!

Don't replace your motherboard, use **KickStart 2™**. When serious hardware problems occur, nothing gets you up and running as fast. **KickStart 2** measures power within 2.5% on all four voltages, shows Power-On Self-Test (POST) failure codes, and features on-board ROM-based diagnostics allowing you to determine and remedy the problem quickly, easily, and inexpensively!

Built-in serial and parallel I/O allows for testing via modem, or simply logging results to a remote terminal, printer or laptop. You can configure your own test routines and store them in **KickStart 2's** battery backed-up CMOS RAM saving valuable setup time. Includes serial and parallel loopback plugs and **Landmark JumpStart™** AT ROM BIOS for testing PCs that don't issue POST codes. **KickStart 2** tests your system regardless of O/S (even UNIX).

On-board switches, LEDs, and digital displays allow complete control over testing in systems lacking video or disk (ideal for motherboard or system burn-in).

KickStart 2 is the ultimate **SECURITY CARD** too! With both supervisor and user levels of password protection, you can prevent unauthorized use of your PC and accidental running of destructive tests. **CALL for current pricing!**

"**KickStart 2** system diagnostics board helps users check out virtually every aspect of a PC's hardware system... the board is a worthy investment for computer maintenance." **David Claiborne, PC Week**

HOW TO DEBUG A DEAD PC

Need an inexpensive solution for dead or problematic PCs and motherboards? Try **KickStart 1™** or **JumpStart ROM POST™**, two quick and easy to use debugging tools.

KickStart 1 test card shows power status on all four voltages and binary PORT 80 Power-On Self-Test codes. The manual translates error codes for easy failed circuit isolation. **CALL for current pricing!**

JumpStart ROM POST is a plug-in chip designed to replace your motherboard BIOS for testing purposes. Tests include CPU register and logic, 8087 math coprocessor, 8253 timer, 8237 DMA controller, 8259 interrupt controller, parity error and memory refresh logic, erroneous maskable/non-maskable interrupt detection, display adapter (MDA, CGA, EGA), keyboard, keyboard controller, floppy controller, drive A: read Base memory at normal & slow refresh rates, and POST checksum. Display of motherboard switch configuration. **CALL for current pricing!**

"Overall, **Service Diagnostics: The Kit** was the best performer. (You can) locate and identify most of the computer problems you'll ever encounter. If you're running a service department, **Service Diagnostics** is not an option, it's a necessity." **Bill O'Brien, PC Magazine**

— Individual pricing available on all kit components, please inquire —

KickStart 2 is ideal for permanent installation. It eliminates the need for an I/O card, provides remote and on-site diagnostic capabilities for quick repair time and offers a solid hardware based solution to unauthorized access with impenetrable password protection.

SLASH DOWNTIME AND OPERATING PROBLEMS

With **PC Probe™** you'll save time and money when your PC starts acting up. In one easy-to-use package you get **Diagnostics, Virus Protection** (for over 700+ known viruses), **Benchmarks, Performance Enhancement Utilities, and System Information**. Combined, this arsenal of tools will keep your system up and running at peak performance and remove the mystery about what's inside.

PC Probe diagnostic testing quickly isolates the source of hardware problems, even locating bad RAM chips. It tests system board, RAM, video, keyboard, com ports, floppy drive, hard drive, Ethernet card and more. Run **PC Probe** tests in batch mode or single pass, remote or on-site.

PC Probe allows you to increase your hard drive data transfer rate by determining optimum interleave and changing it, prevent catastrophic data loss by performing data revitalization, reformat the hard drive, run external programs, display and edit CMOS RAM on-the-fly, prevent accidental hard drive data destruction with passwords, diagnose problems with device drivers installed.

The 200 page on-line manual has built-in table of contents, topic/text search, and troubleshooting tips. **PC Probe** comes with dual size floppies and 9 & 25 pin serial/parallel port loopback plugs. For PC XT, AT, 386, 486 and compatibles using DOS 2.0 or higher. **CALL for current pricing!**

ANYONE CAN INSTALL BACKPACK. ANYONE.

It's never been easier to add external mass storage. In fact, if you can plug in a printer, you can install Backpack. Backpack connects to the parallel printer port of any PC compatible or portable *without* interface cards or tools! Backpack is available in 3.5" and 5.25" diskette, QIC 40 (40/120MB) and QIC 80 (80/250MB)

tape, as well as hard drive models. Several computers can share one Backpack, so you can back up your work or take it home to another computer. So don't monkey around with difficult-to-install drives.

Call for full Backpack information today.

And, we'll beat any USA advertised price.

intersys...The Towering Presence

High Performance 486, 386, and 286 Computer Systems

The Intersys family of computer system embodies an impressive combination of state-of-the-art design, superb engineering and unparalleled value. The result is the flexibility, compatibility and reliability you expect from a leader in the field.

Whether you need a sophisticated high-end 486 or an entry-level 286 system, there's an Intersys out there to suit your needs. Full software compatibility gives you a rich variety of options and ease of network interaction.

Made with pride in the U.S.A., each and every Intersys product is backed by a unique 5-year warranty, as well as outstanding field support, both domestically and internationally.

When you demand superior value, when you want built-in American quality...**think Intersys.**

SmartCache™ Plus: the grow-as-you-go approach to SCSI controllers

START WITH THE BEST...

DPT's entry level SmartCache Plus board offers unrivaled price/performance for single-user systems. It features ISA or EISA bus mastering, and universal SCSI disk compatibility for all PC operating systems. SmartDriver software supports SCSI-2 peripherals like tape and optical drives.

NOW ADD CACHING!

Get DPT's award-winning caching technology in a plug-in module! Move up to disk caching speed without investing in a new controller. With an integral 512K cache, the module provides up to 5X performance gains for workstations, power users, and small multiuser systems.

ADD MORE USERS, ADD MORE CACHE!

Plug in a 2 MB or 4 MB memory module and accommodate up to 18 users from a single card slot. Ideal for medium-sized networks or multiuser systems.

HOW ABOUT DISK MIRRORING?

DPT's SmartCache mirroring module provides 100% disk fault tolerance by simultaneously writing all data to a second "mirrored" drive. No more data loss or costly system down-time due to disk failures. And unlike software mirroring schemes, fault tolerance is achieved with no performance penalties.

PLUS STILL MORE CACHE, AND THEN SOME...

Cable over to DPT's 4 MB Cache Expansion Card, then grow your system to 16 MB by adding more plug-in memory modules—enough power for 64-plus users!

DPT has your solution—no matter how you grow. Performance, compatibility and upgradability make SmartCache Plus the only SCSI controller you'll ever need. For details, contact Distributed Processing Technology, 140 Candace Drive, Maitland, FL 32751. Phone (407) 830-5522; FAX (407) 260-5366.

WHY PAY MORE FOR ADVANCED TECHNOLOGY?

ATronics offers you more for your hard-earned dollar. Highest quality components; customer service and technical support second to no other! Systems designed to avert obsolescence and protect your investment dollar. Motherboards designed with upgradeability in mind.

We've been first since 1985. The very first AT-compatible; the first 486/50 on the market. Dollar for dollar and feature for feature, no competitive system available today can match the ATronics line for technology, quality and value. You owe it to yourself to check our prices. Call us today!

Available as a kit for your existing 3.5" IDE hard disk for just \$69.00.

120MB Removable IDE Hard Disk

If you've been looking at Bernoulli or SyQuest for removable media, ATronics can provide a better solution, one that offers the ultimate in unlimited data storage, security, backup and transportability.

\$425

- 80MB, 200MB & 300MB IDE drives available
- No special drivers required
- Keylock security
- Completely DOS compatible
- Free padded carrying case

Superior performance from a truly portable and affordable system!

386SX-20MHz Notebook

\$1,595

- 20MHz 386SX CPU
- 2MB DRAM, 4MB optional
- 640 X 480 LCD VGA screen, 32 shades of gray
- Dimensions: 8.6"x11"x2", Weight: 6.7 lbs.
- 20MB hard disk standard; 40 & 60MB optional
- 1.44MB floppy disk drive
- Free carrying case
- Other options available at additional cost

Systems Proudly Made in the USA!

W

ITH LIGHTNING FAST SPEED AND HURRICANE POWER, COMTRADE IS TAKING WINDOWS BY STORM. • WHILE

MANY COMPUTERS HAVE ADDED GRAPHICS ACCELERATORS, THEIR REAL-TIME SPEEDS ARE STILL LIMITED BY THEIR 16-BIT AT BUS. • BUT COMTRADE'S 33/486 WIN-STATION USES A REAL 32-BIT LOCAL-BUS VIDEO SLOT TO BYPASS THE AT BUS BOTTLENECK. • THIS ENABLES THE 32-BIT S3 GRAPHICS ACCELERATOR TO CONNECT DIRECTLY TO THE 32-BIT 486 CPU AND RUN AT TRUE CPU CLOCK SPEED—FOR PERFORMANCE UP TO 50 TIMES FASTER THAN STANDARD SVGA! • SINCE NO OTHER COMPUTER CAN MATCH THIS SPEED AT THIS PRICE — IT'S NO WONDER WE'RE BLOWING THE COMPETITION AWAY.

ALL COMTRADE COMPUTER SYSTEMS USE THE MOST EFFICIENT WRITE-BACK METHOD TO ENSURE THAT PROGRAMS RUN AT SUPER FAST 25NS CACHE MEMORY 99% OF THE TIME. •

COMTRADE 486 SYSTEMS ALSO COME WITH AN INCREDIBLE 256K CACHE WHICH IS SO BIG IT MAKES THE SYSTEM AND VIDEO BIOS CACHEABLE. • AND, COMTRADE STANDS BEHIND ALL THEIR PRODUCTS WITH WARRANTIES TO WEATHER ANY STORM — INCLUDING A TWO YEAR PARTS AND LIFE-TIME LABOR WARRANTY.

SX/NOW! PROCESSOR UPGRADE

Kingston Technology Corp.'s SX-Now!
is the undisputed performance champ.

-PC Magazine October 29, 1991

Landmark Speed Test (1.1)

Don't replace your system...

Upgrade your 286 to a 386SX with Kingston's SX/Now!

SX/Now! 80386SX Processor features:

- ✓ Available in 20 or 25MHz
- ✓ 16K bytes of Cache Memory
- ✓ Onboard High Speed Clock
- ✓ Requires No Expansion Slot
- ✓ 80387SX Co-Processor Socket
- ✓ 5-Year Warranty

Now available for:

- ✓ IBM PS/2 25/286, 30/286, 50, 50Z, 60
- ✓ Original IBM AT
- ✓ AST Premium 286 and Bravo 286
- ✓ Hewlett-Packard ES286/12 & ES/8

Kingston
TECHNOLOGY CORPORATION

SX/Now! provides true multitasking and background operation for Windows 3.0, OS/2, and 386 specific software. Improves system performance up to 350%!

NEW Snap-Master Software: Data Acquisition for Windows

Discover Snap-Master — the only Windows-based data acquisition and analysis software to achieve high-speed, real-time data acquisition with multiple simultaneous A/D boards.

Snap-Master lets you define your own custom instruments using icons and easy-to-understand flow charts. A pre-defined database of sensors is integrated with the data acquisition system.

#HDS 200 Snap-Master Acquisition Module.....\$995

#HDS 210 Snap-Master Analysis Module.....\$495

100 MHz PC-Based Scope

CompuScope 250 from Gage Applied Sciences is a family of high quality 100 MegaSPS PC/XT-compatible Data Acquisition Cards with advanced oscilloscope software. Features include:

- 100MHz sampling on one channel or 50MHz simultaneous sampling on two channels
- 8-bit resolution
- 50MHz bandwidth
- 32 or 128-KiloByte memory buffer
- Programmable gains
- Store and load setups and signals
- Drivers available in C, Pascal and Basic.

VGA to your VCR

Tape VGA Animation

Redlake TapeCaster VGA to Video Converter

Redlake's **TapeCaster** converts VGA screen output to video for applications such as animation and creating training tapes. The TapeCaster is extremely easy to use: no base addresses, no interrupts, no software — just plug and play.

- True, precise NTSC or PAL video timing.
- Simultaneous VGA and video display.
- Composite Video & Y-C (SuperVHS) output for use with equipment ranging from an inexpensive VCR to broadcast-quality professional video.

#NTSC 200 TapeCaster - NTSC Video Output \$750

#PAL 200 TapeCaster - PAL (Europe) Video Out. \$750

#NTSC 100 NTSC Video Digitizer w/software \$1650

New GPIB Controllers Support IEEE-488.2 Standard

The new IEEE-488.2 standard has made it easier than ever to program and control GPIB devices. Manufactured by **National Instruments**, these boards allow you to control and gather data from up to 15 devices with IEEE-488 interfaces. Our **AT GPIB** and **Micro-Channel** controllers support data transfers at up to 1 Million samples/second. (No re-writes! Older software fully supported!)

Low-Cost Data Acquisition with the PCL 812

Advantech has made data acquisition extremely affordable. Their **PCL 812** boards offer 16 input channels and high speed acquisition; despite their low cost these boards have not sacrificed anything in terms of performance or advanced capabilities.

- 16 Single-Ended Analog Input Channels and 2 Analog Output Channels.
- Up to 30,000 Samples Per Second with 12-bit Resolution.
- 16 Digital Input Lines and 16 Digital Output Lines.

#PCL 812 30KHz, 16-Channel, Low-Cost A/D Board w/ BASIC Drivers.....\$395

You CAN Have it All!

Low cost and high performance now go hand-in-hand. The new **LCDAS** series of Data Acquisition boards from **Analogic** give you all of the features of boards costing several times more money. Dual DMA processing combined with a full 16-bit AT-bus interface lets you process data as fast as your LCDAS board can sample it. A quick glance at the Block Diagram will show you that all recommended internal circuitry has been provided. Free software drivers and extremely flexible control of operating modes makes development efforts a breeze.

#LCDAS 125 125KHz, AT-Bus Data Acquisition Board.....\$650

CyberResearch April

PC Systems Handbook for Scientists & Engineers

This Combination Tutorial/Catalog Includes Many Examples of PC-based Scientific & Engineering Systems

Have you wanted to enjoy the many benefits of configuring your own PC-based Data Acquisition or Instrumentation system, but didn't know where to begin? The **PC Systems Handbook** will lead you every step of the way, explaining all aspects of systems configuration with easy-to-understand text and clearly documented diagrams. A detailed glossary and two dozen "Tech Notes" help you understand the

terminology. Our new **1992 Edition** will be expanded to 196 pages with a hard spine, making it suitable as a permanent addition to your bookshelf. And there is **absolutely no charge** for this invaluable reference book delivered within the United States. A handling charge is required for Handbooks sent overseas. Please call or Fax for information.

Topics Covered Include:

- Industrial Rack-Mount PC's — AT, 80386, & New 80486 Models
- Real-Time Data Acquisition, Analysis, & Process Control Software
- PC Plug-in Boards for Analog/Digital, Digital/Analog, & Digital I/O
- Connect your PC to Test Instrumentation with IEEE-488, RS-232, RS-422
- Stepping and Servo Motor Control with your Personal Computer

Circle 302 on Inquiry Card.

Notice to International Customers

You can buy direct from CyberResearch and **save 50% or more!** A majority of the leading brands of PC-based engineering products are available for export from CyberResearch at the same low prices as those enjoyed by our customers in the United States.

Due to contractual restrictions, products from some manufacturers are not available for export to certain countries.

Please fax a request for quotation listing brand and/or performance requirements, and we'll fax back a prompt response.

CyberResearch System of the Month Features RTI DAS from Analog Devices

Package includes Labtech Notebook

The RTI series of data acquisition boards were designed by **Analog Devices** with industrial users in mind. With the lowest MTBF in the industry, these are the boards to choose when reliability is critical. Designed from the outset to be compatible with the full line of Analog Devices' signal conditioning mod-

ules, these boards can be used for the broadest possible range of data acquisition applications.

CyberResearch has now made this top-of-the-line product affordable for everyone. By bundling an **RTI 815A** together with **Labtech Notebook** software at one low price, we've saved over \$500 and made it possible for you to afford the very best.

Labtech Notebook

Each combination package contains:

- **RTI 815A** DAS board configured for 32 S.E. or 16 Diff analog input channels with 50KHz A/D conversion rate, 2 analog output (D/A) channels, 16 Digital I/O and 3 Counter/Timer I/O.
- **Labtech Notebook** menu-driven software with new IconView diagramming user interface and drivers for the RTI 815A board.

#RTI 815LN RTI DAS Combination Package\$1995

Guarantee Valid Data with Signal Conditioning Modules

Signal conditioning modules serve several purposes; they protect your computer, isolate your signal of interest from noise, amplify low-level signals, and provide power and excitation to transducers.

One name is virtually synonymous with signal conditioning: **Analog Devices**. And CyberResearch is your Analog Devices distributor carrying every signal conditioning line: the versatile **3B** series, the low-cost **5B** series, and the new, intelligent **6B** series with on-board A/D conversion.

Product Showcase

PC Products for Scientists & Engineers

When you need PC-compatible equipment for science and engineering, there's only one name to think of: **CyberResearch**. We offer the largest selection of hardware and software for data acquisition, instrumentation, communications, motion control, etc. We stock all your best-known suppliers like those featured on these pages and many more.

FREE Application Engineering

At CyberResearch we have no salespeople. Our engineers have one priority: to help you find the best technical solution to your problems. Calling our Applications Hotline is like having your own free consultant. Call and let our experience work for you.

100% Satisfaction Guarantee

You can order from CyberResearch with confidence. If you are not completely satisfied with your purchase, simply call our toll-free hotline within 30 days of receiving the item. A friendly customer service technician will arrange for a full refund, replacement, exchange, or credit. **No Problem. No Hassle.**

It's Easy to Order

We accept Purchase Orders from:

- Government Agencies
- Fortune 500 companies
- Universities & hospitals

Others may prepay by check or credit card. We also will ship COD with a company check.

Keithley Metrabyte Sets the Standard — AGAIN

The DAS 16 analog converter board has always set the standard for PC-based data acquisition. **Keithley Metrabyte** has now set a new standard for price and performance. A total redesign using ASIC architecture has resulted in complete backwards compatibility, reductions of cost, size, and power consumption, and the addition of many new features, including:

- Programmable gains
- Demand-mode DMA
- Burst-mode timing
- 16 Analog inputs, 2 analog outputs, 32 digital I/O lines, 3 counter/timers
- BASIC drivers and pop-up control panel software included free.

#DAS 1601 100KHz, 16-Channel DAS Board w/Hi-Level Gains (1, 10, 100, 500).....\$895

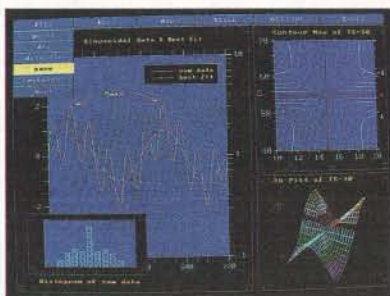

#DAS 1602 100KHz, 16-Channel DAS Board w/Lo-Level Gains (1, 2, 4, 8)\$895

#DAS ASD Advanced Software Option - Windows, C, Visual Basic Drivers\$195

EasyPlot II Scientific Graphing Software

Are you tired of using Lotus to create scientific plots? Now **EasyPlot II** helps you create complex graphs and detailed 3-D plots from your data. Easy-to-use **EasyPlot II** is completely menu-driven. Analysis functions, unlimited display options and journal-quality output make this the package of choice. Makes a perfect companion to our Labtech Notebook data acquisition software.

#SPS 215 EasyPlot II Scientific Plotting and Graphing Software.....\$349

Rack-Mount Printers are Built to Last for Years

Rack-mount printers manufactured by **Syntest** are IBM Proprinter compatible for easy software compatibility. The Epson dot-matrix print head is driven by a fiberglass belt and high resolution stepper motor for near-perfect dot alignment. The absence of gears and cams reduces the parts count and results in a high MTBF. A rugged 1/8" aluminum shell protects the mechanism from harsh environments. Choose Serial (RS-232), 4-20mA, Parallel, or RS-422/485 connections for great cabling flexibility.

New #PRO 521 Rack-Mount Thermal Printer uses a fax-type print head to achieve high speed, high dot-density, and quiet operation.

#PRO 500 Ruggedized Rack-Mount Dot-Matrix Printer\$1350

#PRO 521 Ruggedized Rack-Mount Thermal Printer\$1495

Pick A Card

Volante

Draw
your
winning
card from
National
Design's

**Volante Series
of high speed graphics boards.**

June 25, 1991
National Volante AT1000

All Volante high speed graphics boards offer:

- Built on ISA, MicroChannel or VME bus
- Video memory upgrades to 4 MB
- Program memory upgrades to 4 MB
- Razor sharp resolutions from 1024x768 up to 1600x1280
- Blazing color selection from 8-bit to 24-bit true color
- Optional TI TMS34082 floating point processor for enhanced 3D acceleration
- Superior speed of the TI TMS34020 graphics engine paired with National Design's advanced ASIC technology
- LIFETIME WARRANTY - no gamble here!

Whether your game is CAD, Microsoft Windows, graphic arts, multi-media or medical imaging, Volante has a card for you at a fraction of the cost charged by the competition.

See us at **COMDEX/Spring '92** West Booth #1742

Call **800-253-8831** now for information
on the breathtaking Volante series.

Sending Your Computer to Medical School Helps You Stay Healthy!

Is that indigestion ... or a heart attack? **Doctor Schueler's Home Medical Advisor** gives you an enormous amount of accurate medical information with a few keystrokes. Developed by Board Certified Emergency Physicians and currently used in doctors' offices.

The **Symptom File's** question and answer format generates over 600 illustrations and 450 diagnoses.

The **Disease File** gives info about the symptoms and treatment of over 450 diseases. Know EXACTLY which specialist treats your problem.

Learn how to treat over 130 injuries with the **Injury File**, everything from frostbite to ankle sprains.

Identify and learn the side effects of over 800 prescription and over-the-counter drugs with the **Drug File**.

Included are a **Test File** of medical tests and a **Poison File** listing household ingestions — great for mothers with toddlers. Registered users will be eligible for updates at a cost of five dollars, so YOUR medical encyclopedia NEVER goes out of date. Call now. This indispensable reference tool prints medical information for family and friends and makes learning FUN!

Manufacturer's suggested price: \$99.95

Introductory offer: **\$69.95** 512K RAM EGA/VGA

The Only Thing More Reliable Than Our Products Is Our Customer Service.

We may carry the widest selection of the most dependable products in the industry but it's our customer service that sets us apart. And when you want to upgrade your computer, that's important.

At Universal, we're knowledgeable about all of our products. So we'll be able to help you figure out what you need and how to install it.

And we'll do it in a way

that'll be very understandable.

We'll help you in other ways, too.

Our prices are very competitive. And every product is checked for quality before it's shipped. Plus, you can have your order sent same day, overnight or whatever way you want.

And after you receive your order, you won't have anything to worry about either.

Because everything we sell comes with a 5 year warranty, a 30 day, money back guarantee and is guaranteed to be compatible with your computer. So you're covered no matter what happens.

Also, you can always phone, fax or mail us with any questions regarding our company or products. And we'll

be happy to give you the information you want.

Overall, no one else works with you as much as we do.

So if you want to upgrade your computer and you need more than a product listing, call Universal. We'll provide you with products and service that'll help you every step of the way.

YOU DIDN'T BUY A FAX CARD SIMPLY FOR YOUR READING PLEASURE.

Today's fax cards provide you with an untouchable static image that can only be read.

Before you can revise or edit an incoming computer fax you must retype the entire document into your PC.

That is, unless you have new FAXGrabber™, the only Windows fax utility that

automatically converts fax images into more than 50 word processing, desktop publishing and spreadsheet programs. And because it uses Calera's award-winning OCR technology, accuracy and ease of use are assured. To save \$50, order today.

BayTech
steps into
the future with ...

460k BAUD FOR HIGH SPEED PRINTING

BAYTECH INTRODUCES

Tran·x™

A NEW PRODUCT SERIES FOR HIGH SPEED COMMUNICATIONS

The new Tran·x LPT-460 is an expansion/extender card that allows your network file server, graphics workstation, or PC to output data at speeds up to 460k baud at 1000 feet, or even greater distances at lower speeds.

The Tran·x LPT-460 converts parallel data to serial which can then be transmitted to the Tran·x SP-01 serial to parallel converter module. You can also use the LPT-460 with BayTech Model 24SII or LaserShare for the fastest peripheral sharing solutions available anywhere.

TRAN·X LPT-460 FEATURES:

- High speed data output at extended distances
- Easy to install card plugs into your PC expansion slot
- Adds an additional parallel port, configurable as LPT1-LPT3
- Baud rates from 300 to 460k
- EIA-232 or EIA-422 data transmission
- Connects to Tran·x SP-01 converter module, BayTech peripheral sharing devices, or other serial devices

TRAN·X SP-01 FEATURES:

- Connects to your printer's centronics port
- Serial input speeds up to 460k baud
- Reports printer status back to PC
- 128 byte buffer for XON/XOFF handshaking

With more than 1 million connections, BayTech has been serving users for over 15 years. Buy with confidence and let BayTech be your step into the future. For reliable, high performance, affordable printer sharing devices, multiplexers, modems and data acquisition/control devices, contact a BayTech representative toll-free today!

Polaroid

Polaroid Corporation introduces a new product to its family of Circular Polarizer Filters for computer monitors. The CP-Workstation Filters provide the ultimate in glare reduction and contrast enhancement by utilizing circular polarizing technology along with top quality, durable optical glass and coatings. The CP-Workstation also includes a transparent conductive coating to reduce Electromagnetic Interference for electric field radiation and eliminate static. The CP-Workstation is an optical quality glass filter with conductive coating, designed to fit 16" to 21" monitors.

Polaroid produces a full range of optical quality anti-glare filters in glass and triacetate to fit most monitors from 9"-21".

Get the right connections for \$179. The MiniSCSI™ Parallel-to-SCSI Adapter

Add a SCSI port to almost any printer port with our pocket-sized, self-contained MiniSCSI. Ideal for laptops, notebooks and systems which can't accommodate a standard SCSI interface, the MiniSCSI also lets you relocate SCSI devices easily.

- CD-ROM, hard disk, magneto-optical, SyQuest & Bernoulli support
- SCSI tape support available
- Retains use of parallel port
- Powered by SCSI bus
- Lightweight (only 2.5oz.)
- 2-year parts & labor warranty
- Other SCSI adapters available

1.1 gigabytes in a Toshiba laptop?

Not yet.
But check with us
in mid '92 ...

Right now, we can install the capacity you need, from the smallest Toshiba notebook to the largest laptop.

Our faster (12-25 ms access time), higher-capacity drives won't add bulk or weight. Some are even lighter than the original drives.

Laptop Solutions' unique upgrade packages are thorough and complete. They're installed by appointment only, with a guaranteed 48-hour turn-around, including 24-hour burn-in and stringent testing to industry standards.

Finally, you can put your laptop to work, the way you work!

Quantity discounts available.

TURN YOUR PRINTER INTO A PEN PLOTTER

FPLLOT™ lets you use your printer as a pen plotter. You get fast, high resolution plots with FPLLOT. If you use a CAD or graphics program, you can use FPLLOT to produce your plots with the full capabilities of your printer.

- Supports most dot matrix, laser, and ink jet printers
- High resolution output, no jagged lines
- Faster than pen plotters or most laser built-in and cartridge emulations
- Screen preview with zoom and pan
- Supports background plotting
- Device driver mode plots from inside your graphics program
- Stand-alone mode for fastest plotting
- Plot multiple plots with a single command
- Lets you control line thickness
- Full color plotting support
- Plot large plots on wide carriage printers, or as a mosaic
- Compatible with most CAD and graphics programs
- 100% emulation of the HP 7475A pen plotter

How to Make Great Color Images!

Image-In-Color software for Windows 3.0 is the most advanced true-color, CGA, VGA or 24-bit image processing system available for the PC! Spectacular functions provide a darkroom on your desk, with precise control of pressure, density and size of retouching tools such as pencil, paint brush, air brush and others. Clone items in an image instantly! Use photographic filters for powerful dimensions in design. CMYK color separations are super fine-tuned and calibrated by Agfa Compugraphic. Supports HSV and RGB color, with intuitive color picking. Supports all popular 16- or 24-bit video boards and scanners including:

THE BUYER'S MART

A DIRECTORY OF PRODUCTS AND SERVICES

THE BUYER'S MART is a monthly advertising section which enables readers to easily locate suppliers by product category. As a unique feature, each BUYER'S MART ad includes a Reader Service number to assist interested readers in requesting information from participating advertisers.

Effective January 1, 1992.

RATES: 3 issues—\$625 6 issues—\$600 12 issues—\$525 13 issues—\$500
Prepayment must accompany each insertion. VISA/MC Accepted.

AD FORMAT: Each ad will be designed and typeset by BYTE. Advertisers must

furnish typewritten copy. Ads can include headline (23 characters maximum), descriptive text (250 characters is recommended, but up to 350 characters can be accommodated), plus company name, address and telephone number. Do not send logos or camera-ready artwork.

DEADLINE: Ad copy is due approximately 2 months prior to issue date. For example: November issue closes on September 8. Send your copy and payment to THE BUYER'S MART, BYTE Magazine, 1 Phoenix Mill Lane, Peterborough, NH 03458. For more information call Joseph Mabe at 603-924-2656. FAX: 603-924-2683.

THE BUYER'S MART

PROGRAMMERS TOOLS

DON'T DEVELOP NETWORK APPLICATIONS
without **NPPC**, a powerful library sub-routine package that handles all the details of NetBIOS or IPX programming! **NPPC** supports high-level program communications at the message level for all server/client and peer-to-peer models. If you are using C or Assembler, **NPPC** allows you to write a single application that runs on BOTH IPX AND NetBIOS without any modifications. **NPPC** is compatible with any true NetBIOS emulator, therefore applications written with **NPPC** will work with most LANs in the marketplace. We offer a 30 day money back guarantee.

NPPC for IPX or NetBIOS: \$195.00, with source: \$395.00

No Wild, No Wildlife.

Polar bears, musk-ox, grizzlies, caribou — more animals than you'd find in Yellowstone — can be found on the magnificent coastal plain of the Arctic Refuge in Alaska. Unfortunately, this portion of our last arctic wilderness has caught the eye of the oil industry. Right now Congress is considering proposals that would allow the oil companies to drill there, even though reports indicate there's less than a one-in-five chance oil would be found.

If we allowed drilling in the region, we would jeopardize the culture of the native Alaskans and untold wildlife, including a herd of 180,000 caribou. Our last arctic wilderness would be despoiled.

The Sierra Club works to save wildlife by saving the wilderness. We have a history of victories. And we believe with your help, this arctic wilderness will remain an invaluable refuge.

For information on how you can help:

FREE Software *Instantly On-Line* With **BYTE** **DEMOLINK**

Download free demo software from top publishers directly to your computer. . . for just the cost of a phone call!

BYTE DEMOLINK lets you preview software instantly by calling the telephone number in the city nearest you. All you need to access BYTE DEMOLINK is a PC, a modem and a telecommunications program. The latest demo software is at your fingertips for your evaluation.

Call BYTE DEMOLINK today to connect with these free software demos—It's only a phone call away!

Here are the newest software packages available on DEMOLINK:

AutoPACK Tutor

A powerful interactive computer-based AutoCAD training program for novice or experienced users. Tutor starts with an introductory module on the basics of AutoCAD, includes an exercise module that takes the user through step-by-step instructions of object snap, dimensioning, blocks, etc., and has a complete on-line reference system that replaces AutoCAD "Help" with animated examples and clear explanations. AutoPACK Tutor by Gräbert Systems, Inc.

Select the file **aptdemo.exe**

TropicSoft C++ Classes

A set of the most efficient and complete C++ classes for building MS-DOS Windows application interfaces. Designed to dramatically reduce memory and exe size, increase execution speed and reduce lines of code by as much as 80%. Also features the flex "C" programming to compile in any memory model and run in any Windows mode. (Source code available.)

Select the file **tsdemo.exe**

WINFAX PRO 2.0

Send and receive laser quality faxes from any Windows 3 application directly to any fax device or your PC. WINFAX PRO is recognized by Windows as a print device so a single fax can be composed from within pages of different Windows applications. Specify at what date and time the fax will be sent, and WINFAX PRO will send the fax to either one recipient or a group of recipients. Faxes can be printed or viewed upon receipt. WINFAX PRO manages fax numbers, recipients and groups with its built-in phonebooks. Cover pages can be fully customized to include log files, ASCII text files and fax merge capabilities. Call 1-800-268-6082 for more information.

Select the file **winfax.exe**

ZyINDEX

ZyINDEX, by ZyLAB Corp., is the premiere text retrieval system for DOS and Windows. Search thousands of documents in seconds, regardless of where documents are located or with what word processor they were created.

Select the file **zyindex.exe**

DEMOLINK Windows

Use our new Windows front-end software to automate your DEMOLINK sessions.

Select the file **dlinwin.exe**

Other Software Packages Available:

ASQ, by Qualitas

C++/Views, CNS, Inc.

C-Scape with Look & Feel, Liant Software Corp.

Ways to Keep It Lucid

There's more to desktop publishing than meets the eye

Gabble-gabble, as in the old CP/M manuals, wasn't written for anybody; just "for the record." But a writer ought to envisage a breathing person. The first question should be, "Who'll want it?"

No, rephrase that. People may not know they want it. Let's hope luck will steer them our way. In that hope, the writer's guiding question becomes, "Who needs it?"

Example: You've combined a PC with, say, WordPerfect and a laser printer. Your modest intent is to generate good-looking term papers. You naturally assume you're using an automated typewriter. "Wrong. Professional typesetters know things we don't.... The purpose of this book is to let you in on some of the secrets that have been used for centuries to make type pleasing, beautiful, readable, legible, and artistic—secrets we just weren't taught in Typing 1A." If you lighted on that passage, you were lucky.

It's from the page headed "Read me first" in a book called *The PC Is Not a Typewriter* by Robin Williams. The very look of that page helps Williams make her first point; the book, we're told, was itself produced on a PC. One guiding theme: A typewriter's conventions (e.g., two spaces at sentence breaks, underlining for italics, and dittoes for quotation marks) derive from a small set of characters, all the same width. Proportional spacing leaves such dodges looking terrible. Eighteen short chapters show us what we need to know; more important, they convince us, visually, of our need to know it.

James Felici's *A Desktop Style Guide* contains information of the same order, but it seldom makes you imagine you're being talked to. It's "a quick reference, one to keep on your desk next to your dictionary." A sentence informs us, "Punctuation marks, including periods, commas, and semicolons, should be followed by only one word space." That's the substance of a whole chapter by Williams. ("Word space" means the space you leave after a word, as distinguished from the gaps between letters, which you'd not be aware of till you'd gotten as far as "kerning," by which time you're an advanced student already.) No, not that he is crabbed or she verbose; it's just that she has a reader in mind, still typewriter-oriented, whereas reference manuals assume you know what you're after.

Visit a different niche for another model opening: "Object-oriented technology is arguably the most exciting and least understood development in software today. Given the amount of hype coming from both media and manufacturers, it's hard for corporate managers to assess its true potential." Managers will need that understanding to decide about investing in a massive switchover. In *Object-Oriented Technology: A Manager's Guide*, David A. Taylor offers a crisp 146 pages of help. It's the best overview of object-oriented programming I've found.

Each paragraph in Taylor's nine chapters has a summary in the margin: "Corporations are drowning in data"; "The failure lies in

software"; "Most software is delivered late and over budget"; "We need better software, and we need it faster." That's a neat device for tracking the argument. The diagrams are neat, too. So is a crisp paragraph like this: "It's possible to be quite conversant in 'object-speak' using no more than ten basic terms." (He lists them.) "The appendix at the back of this guide defines these ten concepts." (As it does, with clarity.)

What makes the book exemplary is Taylor's exact conception of just what order of help he's offering to whom. We nonmanagers may profitably eavesdrop.

And in *Advanced Windows Programming*, Martin Heller informs the intrepid that whereas "hello, world" in C needs but five lines, even counting two brackets, the equivalent Windows version uses 80-odd lines in three files. Clearly, we're venturing into something deep; Heller adduces "the dreaded map designation terra incognita" that confronted fifteenth-century sailors.

Those sailors were committed to getting somewhere. Likewise, Heller assumes a reader committed to achieving something venturesome but needing help with vast unknown areas; Windows programming is a very new discipline. Fresh from braving such seas himself, he's comfortable with an author-reader relationship subsumed by "we." We readers are comfortable, too.

Toy programs make points but seldom do anything useful; no one ever pretended that "hello, world" had a use, apart from illustrating elements of syntax. In the real world of Windows, code size is an overarching concern, so we'll work on a long program (an image processor). Most of the book shows how it's developed, chunk by chunk.

I've never used Windows, and know little of C, but I didn't need to spot BYTE's Barry Nance in the list of "beta readers" to feel confident. Deft exposition—not syntactic smoke and mirrors—has an authority you can't mistake. Heller's work, like the others, is serene in its understanding of whom it's for and why. ■

Where Do You Go for Help When You're the Expert?

BIX – the On-Line Service for People Who Know Computers!

Get answers, advice and code from top programmers, designers, and consultants. BIX is home to hardware and software engineers, systems designers, independent consultants, technology buffs and computer industry celebrities. *All sharing information on their favorite subject ... computing!* And the resources on BIX are substantial.

More High-Quality Tools and Information on BIX.

Our software libraries are packed with the latest high-quality tools, programs and code to help you do a better job. So, whether you're looking for a special utility, TSR, highly qualified advice or just stimulating conversation, you'll find it on BIX.

Get Answers in These Conferences and Many Others:

BRAIN

STOP BIT

HIDDEN PERSUADERS

**The computer you use
has a strong effect
on how you
work and think**

We all know how different types of people gravitate toward different types of computers, and I see this process every day walking around campus. In the design school, they use Macs. In engineering, networked Unix workstations dominate the scene. In the business school, you see lots of PCs and clones. Each machine attracts a certain type of person because of its operating system, applications base, and features.

But have you ever thought about how the machine you use affects you as a programmer or developer? The design of the operating system creates an environment, and this environment directly manipulates

your thoughts. Your machine controls your brain.

When you create a program, you are forced to make decisions. The operating system controls those decisions by making certain things easy and other things hard. Being human, we tend to go down the easy path as often as we can, and this directly affects the code and applications that we create on a given machine. All you have to do is look at the applications and utilities on a system to see the long-term effects of these paths.

Take, for example, TSR programs on the PC. Where in the world did they come from? There were none, then there was Sidekick, and then there were a thousand of them almost overnight.

DOS contains a function—the terminate-but-stay-resident function—that lets a piece of code be loaded into memory permanently. Another part of DOS makes it possible for the programmer to inspect incoming keystrokes in the background so that a certain hot-key sequence can be used to activate the TSR even if another application is loaded and running. As soon as someone figured this out, TSRs exploded onto the scene.

Of course, there is a downside to the TSR capability: It makes viruses easy to create as well. And, as you might expect, they also exploded. Unix makes viruses much harder to create so you rarely see them there.

Here's another example. You are writing code and you want to do a `malloc(4000000)`—an allocation request for a 4-MB block of memory. The PC laughs at this request. So does the Mac. But Unix says, "OK." You can bet that controls the way people think! Having access to an almost unlimited memory space changes your brain. It is very freeing.

What about the much-heralded "look and feel" of the

Mac? It is quietly imposed on any developer because it is the only easy way to do things. You can create a Mac-style menu, button, or dialog box with a few lines of code. Doing things any other way would take months of work, so why bother?

And then there is the case of the talking moose. This public domain program runs on a Mac. Every so often, a little dialog box with a moose head in it pops onto the screen, and the moose says something witty using the Mac's voice-synthesis library. Many people who see this program wonder why. I believe that the existence of the talking moose was preordained by the Mac's operating system. The talking moose *had* to be created. Given an operating system that contains a voice-synthesis module, easy drawing and animation facilities, background processing, and desk accessories, the talking moose's existence was as predictable as frost on a cold morning.

No one thought about rotating three-dimensional graphics when computers were as big as barns and executed 20,000 instructions per second. But in a 20-million-instruction-per-second world, 3-D becomes possible, and people think about it all the time. If the operating system supplies a set of canned routines that make it easy, everyone will use it.

Don't be fooled into underestimating the system's effect on you. For example, I distinctly remember seeing a Mac for the first time. I was in college, and three of us piled into my pickup truck to go see the one Mac in Albany, New York. I remember sitting down and using the spray-paint tool in the original MacPaint and feeling my brain explode. It was amazing! You could do *anything* with this machine. I had never even conceived of the things this machine could do, which shows how much of a constraint the PC had put on my mind. It is hard to have graphical dreams in a textual world.

The choices you make as you are creating an application are directly controlled by the environment you work in. Choose carefully. ■

Which would you choose?

✓ **graphics-Menu™** for C & Pascal

✓ **object-Menu™** for C++

object-Menu and graphics-Menu allow the graphics application developer to quickly integrate a remarkable Graphical User Interface into a DOS-based application using Turbo Pascal, Turbo C++, Borland C++, or Microsoft C/C++.

graphics-Menu is a collection of libraries, CASE tools and utilities to enable creation of a professional user interface. Use graphics-Menu standalone with your Borland or Microsoft compiler using the BGI or Microsoft graphics libraries or, in conjunction with Genus GX graphics or MetaWindow.

- Built-in interface elements include windows, icons, menus, multi-column checked and scrolled lists, buttons, text edit window, data entry forms & more.
- CASE tools provide an on-screen WYSIWYG design environment with complete automatic code generation for the target compiler.
- Extensive flexibility for easy modification color, size and format of system elements. Library source is available to allow total control when required.
- Background tasking capability allows a graphics-Menu interface to be run with a real-time application.
- Low memory utilization (including EMS support).
- Complete support for both mouse and keyboard.
- Works with any font or video mode supported by the underlying graphics library.
- Supports Turbo Pascal 6.0, Turbo C++, Borland C++, Microsoft C 6.0, Microsoft C/C++ 7.0

object-Menu is a comprehensive C++ library that allows a complete user interface environment to be quickly integrated with your C++ application.

- Dazzling screens with unlimited combinations of windows, menus, icons, buttons, data entry, dialogue boxes.
- Extensive use of object-oriented programming techniques have produced a system with incredible power in an amazingly compact notation.
- Surprisingly easy to use, even for a C++ programming novice.
- OS/Motif similar look and feel. Choose from bevels, shadows, ridges and stipple patterns to produce varying effects.
- Highly flexible system allows easy customization.
- Complete event and window management.
- Mail system for inter-element communication.
- Interactive hypertext help system (with embedded icons) including a help librarian.
- Sophisticated justified text display capability using mixed fonts and embedded icons.
- Supports Turbo C++, Borland C++, Microsoft C/C++ 7.0. object-Menu can be used with the BGI, Microsoft graphics and MetaWindow.

\$369 object-Menu
\$898 object-Menu with source
\$249 graphics-Menu
\$499 Pro-Pak (includes lib source)
\$799 Super Pro-Pak (all graphics libs)
Specify variant when ordering graphics-Menu (except Super Pro-Pak):
Native (BGI, Microsoft graphics) or
External (MetaWindow, Genus GX graphics)
